### Chapter 1: Introduction
- Avaya G350 Media Gateway Overview
- Avaya G250 Media Gateway Overview
- Features
- What's new in release 4.0
  - SLS survivability enhancements
  - USB port enhancements and enhanced backup functionality
  - Secrets Management
- G250 physical description
- G350 physical description

### Chapter 2: Optional components
- Supported media modules in the G350
  - S8300 media server
  - Telephony media modules
  - WAN media modules
  - LAN media modules
- Media module slot configurations in the G350
  - Permitted slots
  - Combination limitations in the G350
- Supported media modules in the G250

### Chapter 3: Summary of services
- Media gateway services
  - Voice over IP (VoIP)
  - Physical media — G350
  - Physical media — G250
  - Media Gateway Controllers
- Additional features
Appendix C: G250 technical specifications

- G250 specifications
- G250 power cord specifications
- G250 media module specifications

Appendix D: G350 technical specifications

- G350 specifications
- G350 power cord specifications
- G350 media module specifications

Overview for the Avaya G250 and Avaya G350 Media Gateways
About this book

This guide contains information that you need to consider before implementing the Avaya G250 Media Gateway or Avaya G350 Media Gateway. Use this guide to learn what the Branch Gateways can do and to plan how you will deploy a Branch Gateway in your environment.

Audience

The information in this book is intended for use by Avaya technicians, provisioning specialists, Business Partners, and customers.

Downloading this book and updates from the web

You can download the latest version of Overview for the Avaya G250 and Avaya G350 Media Gateways from the Avaya web site. You must have access to the Internet, and a copy of Acrobat Reader must be installed on your personal computer.

Avaya makes every effort to ensure that the information in this book is complete and accurate. However, information can change after we publish this book. Therefore, the Avaya web site might also contain new product information and updates to the information in this book. You can also download these updates from the Avaya web site.

Downloading this book

2. On the left side of the page, click Product Documentation.
   The system displays the Welcome to Product Documentation page.
3. On the right side of the page, type 03-300435, and then click Search.
   The system displays the Product Documentation Search Results page.
4. Scroll down to find the latest issue number, and then click the book title that is to the right of the latest issue number.
5. On the next page, scroll down and click one of the following options:
   - **PDF Format** to download the book in regular PDF format
   - **ZIP Format** to download the book as a zipped PDF file

Technical assistance

Avaya provides resources for technical assistance within the US and internationally.

Within the US

For help with:

- Feature administration and system applications, call the Avaya Technical Consulting Support System at 1-800-225-7585
- Maintenance and repair, call the Avaya National Customer Care Support Line at 1-800-242-2121
- Toll fraud, call Avaya Toll Fraud Intervention at 1-800-643-2353

International

For all international resources, contact your local Avaya authorized dealer.

Sending us comments

Avaya welcomes your comments about this book. To reach us by:

Chapter 1: Introduction

The Avaya CM Branch Gateways (Avaya G250 and G350 Media Gateways) form part of Avaya’s solution for extending communication capabilities from the headquarters of an organization to all collaborative branch locations. Avaya CM Branch Gateways help you provide the same high quality services to all organization members, regardless of their location.

The Branch Gateways are high-performance converged telephony and networking devices that are located in small branch locations, providing all infrastructure needs in one box — telephone exchange and data networking. The Branch Gateways each feature a VoIP engine, WAN router, and Power over Ethernet LAN switch. The G350 provides full support for legacy IP, DCP, and analog telephones. The G250 supports legacy IP and analog telephones. In addition, the G250-DCP model supports DCP telephones.

The G350 is designed for use in an eight to 72 user environment, aimed at branch offices with 16 to 40 stations. The G250 is designed for use in a two to 12 user environment, aimed at small branch offices with two to eight stations.

Telephone services on a Branch Gateway are controlled by a Media Gateway Controller (MGC). You can use a media server running Avaya Communication Manager (CM) call processing software as an MGC. Both the gateways integrate seamlessly with Avaya Media Servers S8700, S8710, S8720, S8500, S8400, and S8300 to provide the same top quality telephony services to the small branch office as to the headquarters of the organization.

The Branch Gateways can subtend to an MGC located at the headquarters or the MGC can be installed locally. The Branch Gateways can optionally house an internal Avaya S8300 media server for Enhanced Local Survivability (ELS), providing full MGC functionality in the event that the connection with the primary MGC is lost, or as the primary MGC for standalone deployment. When the primary MGC is located at a remote location, the Branch Gateway features Standard Local Survivability (SLS). SLS provides partial backup MGC functionality in the event that the connection with the primary MGC is lost.

In addition to advanced and comprehensive telephony services, the Branch Gateways provide full data networking services, precluding the need for a WAN router or LAN switch.

Avaya G350 Media Gateway Overview

The G350 is a modular device, adaptable to support different combinations of endpoint devices. Pluggable media modules provide interfaces for different types of telephones and trunks. A combination is selected to suit the needs of the branch. A LAN media module with PoE standard compliant Ethernet ports provides support for IP telephones as well as all other types of data devices. A range of telephony modules provides full support for legacy equipment such as analog and digital telephones.
Avaya G250 Media Gateway Overview

The G250 supports the connection of PCs, LAN switches, IP telephones, analog telephones, and trunks, via fixed analog and PoE ports on the chassis. A media module slot supports either of two WAN media modules, for connection to a WAN. There are several models of the G250, with various port combinations for support of analog, BRI, or T1/E1 trunks or DCP telephones, as described below.

The G250 is available in the following models:

- Analog model (G250-Analog). The G250-Analog includes four analog trunk ports, two analog line ports, a Fast Ethernet WAN port, and eight PoE LAN ports.
- BRI model (G250-BRI). The G250-BRI includes two ISDN BRI trunk ports, one analog trunk port, two analog line ports, a Fast Ethernet WAN port, and eight PoE LAN ports.
- DCP model (G250-DCP). The G250-DCP provides twelve DCP (Digital Communications Protocol) ports, as well as four analog trunk ports, two analog line ports, a Fast Ethernet WAN port, and two LAN ports.
- DS1 model (G250-DS1). The G250-DS1 provides a T1/E1 and a PRI trunk port, enabling support of fractional T1/E1 and PRI. The G250-DS1 also includes one analog trunk port, two analog line ports, a Fast Ethernet WAN port, and eight PoE LAN ports.

Features

G250 and G350 features include:

- Voice
  - Support for traditional telephones and trunks. In particular, the G250 and G350 support:
    - Two built-in line ports to support two analog telephones or incoming analog DID trunks
    - One analog trunk (four in the G250-Analog and the G250-DCP) to support a trunk or trunks of the following types:
      - Loop start
      - Ground start (G350 only)
      - CAMA (G350 only)
      - DIOD (Japan only)
  - Survivability features for continuous voice services
  - VoIP Media Gateway services
  - Call center capabilities
Features

WAN
- WAN Quality of Service (QoS)
- Routing protocols (OSPF, RIP)
- PPPoE
- Weighted Fair Queuing (WFQ)
- Policy-based routing
- DHCP client, server, and relay functions
- GRE tunneling
- Dynamic IP addressing
- Fax and modem over IP
- Object tracking

Server
- DHCP servers
- TFTP servers

LAN
- Power-over-Ethernet LAN Switching
- VLANs
- Spanning Tree Protocols
  - IEEE 802.1D (STP)
  - IEEE 802.1w (RSTP) (G350 only)
- Port mirroring
- Port redundancy (G350 only)

Security
- RADIUS Authentication support
- SNMP traps (v1 and v2 only) sent to the primary controller
- SNMP v3
- SSH Authentication support
- VPN support
- 802.1x support

Provisioning
- Avaya Communication Manager (CM) media server management
- Extensive alarming and troubleshooting features
- Modem access for remote administration
Introduction

- Survivability
  - MGC automatic switchover, migration, and survivability features
  - Modem backup connection to the MGC
  - Dynamic Call Admission Control (CAC) for Fast Ethernet, Serial, and GRE tunnel interfaces
  - Inter-Gateway Alternate Routing (IGAR)
- Management applications
  - Avaya G250/G350 Manager
  - Embedded Web Manager (G350 only)

What’s new in release 4.0

Release 4.0 includes several new or enhanced features for both the G250 and the G350.

SLS survivability enhancements

SLS is a configurable software module that enables a local Media Gateway to provide a core set of MGC functions when no link is available to the server, an LSP, or an Enterprise Survivable Server (ESS). SLS was first introduced in Release 3.0, and has been enhanced as follows:

- SLS has been extended to the G350 Media Gateway. In this release, SLS is supported for G350 C/S (hardware vintages) 2.0 and up.
- SLS is now supported for ISDN BRI/PRI trunk interfaces on the G250-DS1, G250-BRI, and G350 Media Gateways.
- SLS is now supported for non-ISDN digital DS1 trunk interfaces on the G250-DS1 and G350 Media Gateways.
- SLS now supports extended dial strings of up to 13 digits.
USB port enhancements and enhanced backup functionality

Release 4.0 introduces enhancements to the G250/G350 USB port, which now supports:

- Mass storage devices such as USB flash drives
- USB externally powered hub
- USB 2.0 high speed (480 Mbits/sec), for faster file transfer between the Media Gateway and external USB storage devices

You can now backup and restore all administration and configuration files via the USB port, using a single command. Thus, you can backup all administration data to a USB flash drive using one CLI command, and restore this data using another CLI command. This is an improvement over the previous method of backup and restore, in which files were backed up and restored one by one, using TFTP/FTP/SCP servers.

This new backup and restore functionality is especially useful for replicating or restoring a Media Gateway, and for replacing or adding Media Modules.

Secrets Management

Release 4.0 introduces a mechanism for storage, backup, and restore of sensitive materials (secret passwords and keys) maintained in the Media Gateways.

Up to this release, all secret materials maintained by the Media Gateway resided in the local FLASH memory. Write-only rules applied to these secrets since the Media Gateway never output secrets to a management terminal or to a startup-config file. Thus, secrets could not be read back once entered - an administrator could only overwrite secrets but could not read old secrets entered by other administrators. This approach provided maximum security at the price of forcing users to manually re-enter secret materials when a Media Gateway was replaced.

The new mechanism works as follows:

All secret materials that up to this release had been stored in a separate persistent repository can now be saved in the startup-config file together with other configuration parameters. To prevent disclosure of the secrets, the Media Gateway encrypts the secrets using a Master Configuration Key (MCK) before storing them in the startup config file. The MCK is a 128 bit key that is derived from the passphrase entered by an administrator.

During upload of the configuration file to volatile memory or during download of the configuration file from a remote file server (or a USB flash drive), the Media Gateway uses the MCK to decrypt the secrets stored in the configuration file.

Thus, a user can move configurations including secrets from one device to a different device. All that is required is that the administrator configure the same MCK in the target device before executing the copy operation.

2 of 2
Chapter 2: Optional components

The Avaya G350 Media Gateway is a versatile device with powerful capabilities. To implement the various services that are supported, a variety of swappable internal components called media modules are available.

Unlike the G350, the Avaya G250 Media Gateway LAN switching and voice ports are built into the G250’s chassis. However, the G250’s WAN and call controller options are modular, and accommodate the G350’s data WAN media modules, as well as the S8300 media server.

### S8300 media server

The S8300 media server is a Pentium-based processor that runs a Linux operating system. The S8300 runs Avaya Communication Manager (CM) to provide call control services to the G350. The G350 is compatible with Avaya CM from version 2.1 onwards and backwards compatible with Avaya CM 2.0.

The S8300 media server features:

- Avaya Native Configuration Manager. An administration tool that provides terminal emulation capabilities and a variety of connectivity options you can save and reuse.
- A 30GB hard disk
- 512 MB RAM
- A WEB server used for the following:
  - Backups and restores for customer data
  - Easy access to view current alarms
  - The ability to perform server maintenance, shutdown, and status of the S8300 Media Server
  - Security commands that can enable and disable the modem, start and stop the FTP server, and view the software license
  - SNMP access to configure trap destinations and stop and start the master agent
- S8300 Media Server configuration information and upgrade access
- The ability to download the Avaya Native Configuration Manager from the S8300 Media Server to a PC on the LAN

- Linux operating system (Redhat v8.x)
- Interface for IA770 INTUITY AUDIX Messaging, a software-only version of INTUITY AUDIX messaging that resides on the hard drive of the S8300 Media Server. For more information, see the description of the S8300 Media Server in the *Hardware Description and Reference for Avaya Communication Manager*, 555-245-207.

- Trivial File Transfer Protocol (TFTP) server
- Security/firewall configuration
- H.248 Media Gateway Signaling Protocol
- Control messages tunneled over H.323 Signaling Protocol
- One 10/100Base-T Ethernet switch port used as a Services port
- Two USB ports for modem connections
- SNMP alarming
- Support for remote call out alarming

**Figure 6: The S8300 media server**

---

**Telephony media modules**

The G350 supports the MM711, MM714, and MM716 analog media modules, the MM312, MM712, and MM717 DCP media modules, the MM710 E1/T1 media module, and the MM720 and MM722 BRI media modules.

**MM711 analog media module**

The MM711 provides analog trunk and telephone features and functionality.

**Configuring MM711 ports**

The administrator can configure any of the eight ports of the MM711 as follows:

- Central office trunk, either loop start or ground start
- Analog Direct Inward Dialing (DID) trunks, either wink start or immediate start
Optional components

- 2-wire analog Outgoing CAMA E911 trunks for connectivity to the PSTN
- MF signaling is supported for CAMA ports
- Analog, tip/ring devices, such as single-line telephones with or without LED message waiting indication

**MM711 also supports**

- Three ringer loads (ringer equivalency number) for up to 2000 feet for all eight ports
- Up to eight simultaneously-ringing ports

**Note:**
The media gateway achieves this number of ports by staggering the ringing and pauses between two sets of up to four ports.

- Type 1 Caller ID
- Ring voltage generation for a variety of international frequencies and cadences

---

**Figure 7: The MM711 media module**

---

**MM714 analog media module**

The MM714 analog media module provides four analog telephone ports and four analog trunk ports.

**Note:**
The four analog trunk ports can *not* be used for analog DID trunks. Instead, the four analog line ports must be used.

---

**Figure 8: The MM714 media module**

---

**Configuring MM714 ports**

The MM714 provides you with the capability to configure any of the four trunk ports as:

- A loop start or a ground start central office trunk with a loop current of 18 to 120 mA
- A two-wire analog Outgoing CAMA E911 trunk, for connectivity to the PSTN. MF signaling is supported for CAMA ports.
Configuring MM714 line ports
The MM714 provides you with the capability to configure any of the four line ports as:

- A wink start or an immediate start DID trunk
- Analog tip/ring devices such as single-line telephones with or without LED message waiting indication

MM714 also supports

- Three ringer loads, which is the ringer equivalency number for up to 2,000 feet (610 meters) for all eight ports
- Up to four simultaneously-ringing ports
- Type 1 caller ID and Type 2 caller ID
- Ring voltage generation for a variety of international frequencies and cadences

MM716 analog media module
The MM716 provides 24 analog ports supporting telephones, modem, and fax. These ports can also be configured as DID trunks with either wink-start or immediate-start. The 24 ports are provided via a 25 pair RJ21X amphenol connector, which can be connected by an amphenol cable to a breakout box or punch down block.

Configuring MM716 ports
The MM716 provides you with the capability to configure any of the 24 ports as:

- Analog tip/ring devices such as single-line telephones with or without LED message waiting indication
- A wink-start or an immediate-start DID trunk

MM716 also supports

- Three ringer loads, which is the ringer equivalency number for up to 2,000 feet (610 meters) for all 24 ports
- Up to 24 simultaneously-ringing ports
- Type 1 caller ID
- Ring voltage generation for a variety of international frequencies and cadences
Optional components

The MM716 is compatible with Avaya Communication Manager release 3.1 and higher, and branch gateway firmware version 25.0.0 and higher.

**MM312 DCP media module**

The MM312 DCP media module provides 24 Digital Communications Protocol (DCP) ports with RJ-45 jacks. The MM312 supports simultaneous operation of all 24 ports. Each port can be connected to a two-wire DCP telephone. See Appendix B: Supported Avaya products for a list of compatible DCP telephones.

**Note:**
The MM312 does not support four-wire DCP telephones.

---

**Figure 10: The MM312 media module**

---

**MM712 DCP media module**

The MM712 DCP media module provides eight DCP telephone ports. The ports support two-wire Digital Communications Protocol (DCP) telephones. See Appendix B: Supported Avaya products for a list of compatible DCP telephones.

---

**Figure 11: The MM712 media module**

---

**MM717 DCP media module**

The MM717 DCP media module provides 24 DCP ports of two-wire DCP functionality exposed as a single 25-pair amphenol connector. The DCP ports are exposed by connecting the module via a standard amphenol cable to a punch-down block with RJ-11 jacks. The MM717 allows you to use one of the smaller media module slots for a large number of DCP telephones.
**MM710 E1/T1 media module**

The MM710 T1/E1 media module terminates a T1 or E1 trunk. The MM710 has a built-in Channel Service Unit (CSU) so an external CSU is not necessary. The CSU is only used for the T1 circuit.

The MM710 features:

- ISDN PRI capability (23B + D or 30B + D)
- Trunk signaling to support US and International CO or tie trunks
- Echo cancellation in either direction

**MM720 BRI media module**

The MM720 BRI media module provides eight ports with RJ-45 jacks that can be administered either as BRI trunk connections or BRI endpoint (telephone and data module) connections.

**Note:**

The MM720 BRI media module cannot be administered to support both BRI trunks and BRI endpoints at the same time. Also, the MM720 BRI media module does not support combining both B-channels together to form a 128-kbps channel. Finally, if the MM720 BRI Media Module is administered to support BRI endpoints, it can not be used as a clock synchronization source.

For BRI trunking, the MM720 BRI media module supports up to eight BRI interfaces to the central office at the ISDN TE reference point. Information is communicated in two ways:

- Over two 64-kbps channels, called B1 and B2, that can be circuit-switched simultaneously
- Over a 16-kbps channel, called the D-channel, that is used for signaling. The MM720 occupies one time slot for all eight D channels

The circuit-switched connections have an A- or Mu-law option for voice operation. The circuit-switched connections operate as 64-kbps clear channels when in the data mode.
Optional components

For BRI endpoints, the MM720 BRI media module supports up to 16 BRI stations and data modules that conform to AT&T BRI, World Class BRI, and National ISDN NI1/NI2 BRI standards. The MM720 BRI media module provides -40 volt phantom power to the BRI endpoints.

**Figure 14: The MM720 media module**

---

**MM722 BRI media module**

The MM722 BRI media module provides two 4 wire S/T ISDN BRI (Basic Rate Interface) 2B+D access ports with RJ-45 jacks. Each port interfaces to the central office at the ISDN T reference point. Information is communicated in the same manner as for the MM720. See [MM720 BRI media module](#) on page 29.

**Figure 15: The MM722 media module**

---

**Note:**

The MM722 media module does not support BRI stations or combining both B channels together to form a 128-kbps channel.
WAN media modules

The G350 supports the MM340 E1/T1 and MM342 USP WAN media modules.

MM340 E1/T1 WAN media module

The MM340 E1/T1 WAN media module provides a WAN access port for the connection of an E1 or T1 WAN.

Figure 16: The MM340 media module

MM342 USP WAN media module

The MM342 media module provides one USP WAN access port. MM342 supports the following WAN protocols:

- V.35/ RS449
- X.21

Necessary cable

For these connections, one of the following cables is necessary:

- Avaya Serial Cable DTE V.35 (USP to V.35)
- Avaya Serial Cable DTE X.21 (USP to X.21)

Figure 17: The MM342 media module
LAN media modules

The G350 supports the MM314 and MM316 LAN media modules.

MM314 LAN media module

The MM314 LAN media module provides:

- 24 Ethernet 10/100 Base-T Ethernet access ports with inline Power over Ethernet (PoE).
- One Gigabit Ethernet copper port for server connection or uplink to another switch or router.

The MM314 supports 48V DC inline power provided over standard category 5 UTP cables (up to 100m range) on each PoE port.

Power consumption for the MM314 media module is 335W.

MM314 features

- Priority power budgeting with configurable priorities
- Automatic load detection on ports
- Automatic device discovery
- Enable/disable port powering option
- Port monitoring
- Automatic recovery from overload shutdown
- Automatic recovery from no-load shutdown

Figure 18: The MM314 media module

Versions of the MM314 LAN media module with Material Code 700384 (C/S:2.0) require Avaya CM version 2.0 and higher, and G350 firmware version 25.0.0 and higher.

For more information about PoE, see Power over Ethernet (PoE) on page 46.
MM316 LAN media module

The MM316 LAN media module provides:

- 40 Ethernet 10/100 Base-T Ethernet access ports with inline Power over Ethernet (PoE).
- One Gigabit Ethernet copper port for server connection or uplink to another switch or router.

The MM316 supports 48V DC inline power provided over standard category 5 UTP cables (up to 100m range) on each PoE port.

Power consumption for the MM316 media module is 435W.

MM316 features

- Priority power budgeting with configurable priorities
- Automatic load detection on ports
- Automatic device discovery
- Enable/disable port powering option
- Port monitoring
- Automatic recovery from overload shutdown
- Automatic recovery from no-load shutdown

The MM316 is compatible with Avaya CM version 2.0 and higher, and G350 firmware version 25.0.0 and higher.

For more information about PoE, see Power over Ethernet (PoE) on page 46.
Media module slot configurations in the G350

When choosing a combination of media modules to install in the G350 chassis, consider the slots in which each module type can be housed, and the limitations and recommendations regarding combinations of media modules.

Permitted slots

The G350 chassis has six media module slots, marked V1, V2, V3, V4, V5, V6 (see G350 physical description on page 20). Each media module is restricted to certain slots.

<table>

Combination limitations in the G350

The following limitations apply to combining media modules in the G350:

- No more than one MM710 media module. In Enhanced Capacity mode – no more than two MM710 media modules.
- No more than three of the following voice media modules in any combination: MM710, MM711, MM712, MM720, MM714, MM716, MM717, or MM722, subject to the following restrictions which do not apply in Enhanced Capacity mode:
  - No more than one of the following modules: MM712 and MM717 (you can combine this module with an MM312)
  - No more than three MM711 and/or MM714
  - No more than two MM716 and/or MM720 and/or MM722

Supported media modules in the G250

The G250 supports the following Avaya media modules:

<table>
<thead>
<tr>

</tr>
<tr>
<td>MM342</td>
<td>1 USP WAN port</td>
</tr>
</tbody>
</table>

⚠️ CAUTION: The MM340 and MM342 media modules are not supported by the Avaya G700 Media Gateway. Do not insert an MM340 or MM342 media module into an Avaya G700 Media Gateway.

For information about the WAN media modules, see [WAN media modules](#) on page 31. For information about the S8300 media server, see [S8300 media server](#) on page 24.

The S8300 media server can be inserted in slot V1. A WAN media module can be inserted in slot V2.
Optional components
Chapter 3: Summary of services

The Branch Gateway (G250 or G350) offers various services, which are described in Media gateway services on page 37, LAN services on page 46, and WAN services on page 48.

Media gateway services

The Branch Gateway provides a telephone exchange service, supporting the connection of various types of telephones and outside telephone lines. Telephones and lines are connected to the Branch Gateway via ports and media modules on the chassis. Different media modules provide access ports for different types of telephones and lines.

Telephony services are controlled by a media gateway controller (MGC) running Avaya Communication Manager (CM) call processing software. You can use the Avaya CM to configure many advanced telephone exchange functions. For more information, see the Administrator’s Guide for Avaya Communication Manager, 555-233-506.

This section describes the services the Branch Gateway provides as a media gateway. All services are supported by both the G250 and the G350 except where otherwise specified.

Voice over IP (VoIP)

The Branch Gateway features a VoIP engine that provides voice services over IP data networks. The Branch Gateway allows you to use many types of telephones and trunks that do not directly support VoIP. The Branch Gateway translates voice and signalling data between VoIP and the system used by the telephones and trunks, as follows: Avaya media modules convert the voice path of traditional circuits such as analog trunk, T1/E1, and DCP to a TDM bus inside the Branch Gateway. The VoIP engine then converts the voice path from the TDM bus to a compressed or uncompressed and packetized VoIP on an Ethernet connection.

Both the G250 and the G350 provide VoIP services over the LAN and WAN. The G350 supports the G.711 codec for up to 32 concurrent calls and the G.729 codec for up to 16 concurrent calls. The G250-Analog and G250-BRI support both the G.711 and the G.729 codec, for a total of 10 concurrent calls. The G250-DCP and G250-DS1 support both the G.711 and the G.729 codec, for a total of 16 concurrent calls.
Physical media — G350

There are various types of telephones and lines supported by the G350 and the access ports provided for their connection.

Telephones

The G350 supports IP telephones, Avaya DCP telephones, analog telephones, and BRI telephones. For information about which Avaya telephones are supported, see Appendix B: Supported Avaya products.

Telephones must be connected to the correct type of port for the telephone type. Different types of telephone ports are provided by different media modules and by fixed ports on the G350 front panel. The table below lists which ports you can use to connect each type of telephone. See Chapter 2: Optional components for more information about each type of port and media module.

Media Gateway Controllers

A Media Gateway Controller (MGC) controls telephone services on a media gateway. An MGC may be internal to the media gateway or external to the media gateway. An Internal Call Controller (ICC) is an internal MGC. An External Call Controller (ECC) is an external MGC that communicates with the Branch Gateway over the network.

An Avaya media server managed with Avaya Communication Manager (CM) software acts as an MGC for the Branch Gateway.

Supported media servers

The MGCs supported by the Branch Gateway include both ECCs and ICCs. Both the G250 and the G350 support the following MGCs:

Table 10: MGCs supported by the Avaya G250 and G350 Media Gateways

</tbody>
</table>

See Chapter 2: Optional components for information about the S8300 Media Server module.
Configuring Branch Gateway options

The Branch Gateway provides the following configuration options to help you ensure continuous telephone services:

- You can configure the Branch Gateway to use up to four media servers. If the MGC is an S8700, S8710, or S8720, the first server on the list will normally be the primary C-LAN board connected to the media server. If the MGC is an S8400 or S8500, the first server on the list will be either the primary C-LAN board connected to the media server or an Ethernet port on the server that has been enabled for processor Ethernet connections. If the MGC is an S8300, the first server on the list will be the IP address of the S8300. The remaining servers will be alternate C-LAN boards connected to the media server (S8400, S8500, or S8700-series media servers), an S8300 configured as an LSP, or the port enabled as the Ethernet processor port on an S8500 configured as an LSP.

- Using the connection preserving migration feature, you can configure the Branch Gateway to preserve the bearer paths of stable calls in the event that the Branch Gateway migrates to another MGC (including an LSP), including migration back from an LSP to the primary MGC. A call for which the talk path between parties in the call has been established is considered stable. A call consisting of a user listening to announcements or music is not considered stable and is not preserved. Any change of state in the call prevents the call from being preserved. For example, putting a call on hold during MGC migration will cause the call to be dropped. Special features, such as conference and transfer, are not available on preserved calls. Connection preserving migration preserves all types of bearer connects except BRI. PRI trunk connections are preserved.

- You can configure Standard Local Survivability (SLS) to enable a local Branch Gateway to provide a degree of MGC functionality when no link is available to an external MGC. SLS is configured on a system-wide basis using the Provisioning and Installation Manager (PIM). Alternatively, SLS can be configured from the individual Branch Gateway itself using the CLI. SLS is supported as follows in the various Branch Gateway models:
  - G350 with C/S (hardware vintage) 2.0 and up: SLS supported for all analog interfaces, ISDN BRI/PRI trunk interfaces, non-ISDN digital DS1 trunk interfaces, IP phones, IP Softphone, and DCP phones.
  - G250-Analog: SLS supported for all analog interfaces, IP phones, and IP Softphone.
  - G250-BRI: SLS supported for all analog interfaces, ISDN BRI trunk interfaces, IP phones, and IP Softphone.
  - G250-DCP: SLS supported for all analog and DCP interfaces, IP phones, IP Softphone, and DCP phone.
  - G250-DS1: SLS supported for all analog interfaces, ISDN PRI trunk interfaces, non-ISDN digital DS1 trunk interfaces, IP phones, and IP Softphone.

- You can configure Enhanced Local Survivability (ELS) by installing an S8300 in the Branch Gateway as a Local Survivable Processor (LSP). In this configuration, the S8300 takes over to provide continuous telephone service if all external media servers become unavailable. Calls in progress continue without interruption when the S8300 takes over.
You can configure the dialer interface to connect to the Branch Gateway’s primary MGC via a serial modem in the event that the connection between the Branch Gateway and the MGC is lost.

You can configure the Avaya CM to support the auto fallback feature, which enables a Branch Gateway being serviced by an LSP to return to its primary MGC automatically when the connection is restored between the Branch Gateway and the MGC. When the Branch Gateway is being served by its LSP, it automatically attempts to register with its MGC at periodic intervals. The MGC can deny registration in cases in which it is overwhelmed with call processing, or in other configurable circumstances. By migrating the Branch Gateway to the MGC automatically, a fragmented network can be unified more quickly, without the need for human intervention.

**Note:**
Auto fallback does not include survivability. Therefore, there is a short period during registration with the MGC during which calls are dropped and service is not available. This problem can be minimized using the connection preserving migration feature.

The Branch Gateway features a dynamic trap manager, which enables you to ensure that the Branch Gateway sends traps directly to the currently active MGC. If the MGC fails, the dynamic trap manager ensures that traps are sent to the backup MGC.

**MGC management**

The MGC is managed by the Avaya Communication Manager (CM). The Branch Gateway supports Avaya Communication Manager (CM) release 4.0 and is backwards compatible with release 2.0 and above.

**Avaya CM features**

Avaya (CM) is an open, scalable, highly reliable, and secure telephony application. Avaya CM provides user and system management functionality, intelligent call routing, application integration and extensibility, and enterprise communications networking. Avaya CM offers over 500 features, in the following categories:

- Telephony features
- Localization
- Collaboration
- Mobility
- Messaging
- Telecommuting
- System management
- Reliability
Summary of services

- Security, privacy, and safety
- Hospitality
- Attendant features
- Networking
- Intelligent call routing
- Application programming interfaces

Avaya CM software applications

- Determine where to connect your telephone call based on the number you dial
- Assign numbers to local telephones
- Play dial tones, busy signals, and prerecorded voice announcements
- Allow or prohibit access to outside lines for specific telephones
- Assign telephone numbers and buttons to special features
- Exchange call switching information with older telephone switches that do not support VoIP

For more information about Avaya CM software, see Administrator’s Guide for Avaya Communication Manager, 555-233-506.

Additional features

The Branch Gateways also provide voice-related features.

Call center capabilities

The G350 supports call center features according to the mode of deployment (see G350 physical description on page 20):

- Distributed Avaya Enterprise Connect mode. The G350 supports up to ten concurrent call center agents. This configuration is supported by CM 2.0 applications and above.
- Standalone mode. The G350 supports a call center application with up to ten concurrent agents. This application is supported by CM 2.1 and above.

Note:

The G250 does not support call center features.
Emergency Transfer Relay (ETR)

The Emergency Transfer Relay (ETR) feature provides basic telephone services in the event of a power outage or a failed connection to Avaya Communication Manager. Using ETR, you can connect:

- In the G350, the fixed analog trunk port (TRUNK - V701) to the first analog line port (LINE - V702)
- In the G250-Analog, the fourth fixed analog trunk port (TRUNK - V304) to the first line port (LINE - V305)
- In the G250-BRI, the fixed analog trunk port (TRUNK - V301) to the first analog line port (LINE - V302)
- In the G250-DCP, the fourth fixed analog trunk port (TRUNK - V304) to the first line port (LINE - V305)
- In the G250-DS1, the fixed analog trunk port (TRUNK - V301) to the first line port (LINE - V302)

⚠️ WARNING:
Do not enable ETR on ports used for DID.

An outside telephone exchange can be connected to the trunk port, and an analog telephone can be connected to the line port. All calls are then directed by the analog relay between the outside line and the analog telephone. A current-loop detection circuit prevents ongoing calls from being disconnected when normal functioning resumes. It is recommended that ETR not be enabled for line ports that are administered for use with analog DID trunks.

Contact closure

The contact closure feature is a controllable relay providing dry contacts for various applications. To implement the contact closure feature, connect an Avaya Partner Contact Closure Adjunct box to the CCA port on the Branch Gateway chassis. The adjunct box provides two contact closures that can be operated in either a “normally closed” or “normally open” state. The contact closures can control devices such as devices that automatically lock or unlock doors or voice recording units. The CCA port can be configured so that the connected devices can be controlled by an end device, such as a telephone. For example, a user can unlock a door by keying a sequence into a telephone keypad.

Fax, modem, TTY over IP

The Branch Gateway supports fax, modem, and TTY over IP.
LAN services

You can use both the Avaya G250 Media Gateway and the Avaya G350 Media Gateway as a LAN switch. You can also integrate the Branch Gateway into an existing LAN.

Physical media

The G350 provides LAN services through the following Ethernet ports for the connection of local data devices:

- **Switched LAN ports.** Configurable switched Ethernet ports on the MM314 media module (see MM314 LAN media module on page 32) and the MM316 media module (see MM316 LAN media module on page 33). The switched Ethernet ports support HP auto-MDIX, which automatically detects and corrects the polarity of crossed cables. This results in simplified LAN installation and maintenance.

- **Fixed LAN port.** The fixed LAN port on the chassis, connected to the internal LAN switch. The fixed LAN port supports HP auto-MDIX, which automatically detects and corrects the polarity of crossed cables. This results in simplified LAN installation and maintenance.

The G250 provides LAN services through eight fixed ETH LAN PoE ports on the chassis.

*Note:* The G250-DCP only has two fixed ETH LAN ports. These ports do not support PoE.

Power over Ethernet (PoE)

In the G350, the MM314 and MM316 media modules’ ports provide power to data devices over the Ethernet connection (PoE). The ports support the connection of IP phones and wireless access points, which you may want to power through the G350.

In the G250, PoE service is provided by eight fixed ETH LAN PoE ports on the chassis.

*Note:* The G250-DCP does not provide PoE service.

The inline PoE feature enables you to power data devices through the Branch Gateway. Power is distributed between the PoE ports, according to configured priorities. You configure the power priority on each port. Distribution is calculated from the actual power consumption.

An automatic discovery system detects when powered devices are connected to and removed from the PoE ports. Automatic load detection:

- Tests whether the device connected to the port requires remote powering
- Controls the power injection to the wires
VLANs

In the G350, you can configure VLANs on the fixed LAN port and on the MM314 and MM316 ports. In the G250, you can configure VLANs on all Ethernet ports except the WAN ETH port. Both the G250 and the G350 support up to eight VLANs. The following VLAN features are supported:

- VLAN port grouping. Port VLANs can be used to group LAN ports into logical groups.
- Ingress VLAN Security. You configure a list of ingress VLANs on each port. Any packets tagged with an unlisted VLAN are dropped when received on the port.
- Class of Service (CoS) tagging. Packets are tagged with VLANs per CoS.
- Inter-VLAN routing. You can configure specific VLANs to permit access to the WAN while others can be configured to deny access to the WAN.

Spanning Tree Protocol (STP)

The IEEE 802.1D (STP) and IEEE 802.1w (RSTP) Spanning Tree Protocols are supported on the MM314 and MM316 switched LAN ports.

Note:
STP is not supported in the G250.

Port mirroring

Both the G250 and the G350 support network traffic monitoring by port mirroring. You can configure port mirroring on any LAN port. You implement port mirroring by connecting an external traffic probe device to one of the LAN ports. The probe device monitors traffic that is sent and received through other ports by copying the packets and sending them to the monitor port.

Note:
You cannot configure port mirroring on the G350 fixed LAN port or the G250/G350 WAN Fast Ethernet ports.
Port redundancy

You can configure port redundancy on the G350. Port redundancy allows you to provide both a primary link and a backup link to an important resource. Port redundancy is supported between any two PoE ports on the MM314 or the MM316 media modules.

Note:
The G250 does not support port redundancy.

WAN services

The Branch Gateway has an internal router and provides direct access to outside WAN lines. You can use the Branch Gateway as the endpoint device for a WAN line. You can also use the Branch Gateway as the router for a WAN line with an external endpoint device.

Physical media

To use the Branch Gateway as the endpoint device for a WAN, install a WAN media module and connect the WAN line to a port on the media module. When you connect a WAN line to a media module, the Branch Gateway serves as the router for the WAN line.

You can also use the fixed ETH WAN Fast Ethernet port as a WAN endpoint by configuring the port’s interface for PPPoE encapsulation.

To use the Branch Gateway as a router, connect the external endpoint device to the fixed WAN port on the Branch Gateway front panel using a standard network cable. See G250 physical description on page 16 and G350 physical description on page 20 for the location of the WAN port on the G250 and G350 front panels.

You can also use the fixed WAN port to connect a computer or other endpoint data device to the Branch Gateway.

Branch Gateway support

The Branch Gateway supports the following types of WAN line:

- E1/T1
- USP
- PPPoE
Media modules necessary for each WAN line

The table below lists which media modules to install to connect each type of outside WAN line. For more information about each type of media module, see Chapter 2: Optional components.

Table 11: Outside WAN lines supported and matching media modules

<table>
<thead>
<tr>

</tbody>
</table>

WAN features

The G350 supports the following WAN features. The G250 also supports these features, except where otherwise noted.

- Traffic shaping. The traffic shaping function estimates the parameters of the incoming traffic and takes action if it measures traffic exceeding agreed parameters. The action could be to drop the packets or mark them as being high drop priority.
- PPP over channeled and fractional E1/T1. The Branch Gateway has the ability to map several PPP sessions to a single E1/T1 interface.

**Note:**

The G250 only supports fractional E1/T1.

- PPP over USP.
- PPPoE.
- Unframed E1 for enabling full 2.048 Mbps bandwidth usage.
- Point-to-Point Frame Relay encapsulation over channelized/fractional/unframed E1/T1 ports or over a USP interface.
- Frame Relay LMI types supported: ANSI (Annex D), ITU-T:Q-933 (Annex A0), LMI-Rev1, and No LMI.
- Backup functionality supported between any type of Serial Layer 2 interface.
- Dynamic Call Admission Control (CAC) for Fast Ethernet, Serial, and GRE tunnel interfaces. Dynamic CAC provides enhanced control over WAN bandwidth. When Dynamic CAC is enabled on an interface, the Branch Gateway informs the MGC of the actual bandwidth of the interface and tells the MGC to block calls when the bandwidth is exhausted.
Summary of services

- Quality of Service (QoS). The Branch Gateway uses Weighted Fair VoIP Queuing (WFVQ) as the default queuing mode for WAN interfaces. WFVQ combines weighted fair queuing (WFQ) for data streams and priority VoIP queuing to provide the real-time response time that is required for VoIP. The Branch Gateway also supports the VoIP Queue and Priority Queue legacy queuing methods.

- Weighted Random Early Detection (WRED). The Branch Gateway uses WRED on its ingress and egress queues to improve the performance of the network when overloaded. The purpose of WRED is to indicate to transmitting hosts to reduce their transmission speed when the ingress G350 queues are congested.

- Policy. Each interface on the Branch Gateway can have four active policy lists:
  - Ingress Access Control List
  - Ingress QoS List
  - Egress Access Control List
  - Egress QoS List

  Access control lists define which packets should be forwarded or denied access to the network. QoS lists change the DSCP and 802.1p priority of routed packets according to the packet characteristics.

- Policy-based routing. The Branch Gateway features policy-based routing, which uses a policy list structure to implement a routing scheme based on traffic source, destination, type, and other characteristics. You can use policy-based routing lists (PBR lists) to determine the routing of packets that match the rules defined in the list. Common applications include separate routing for voice and data traffic, routing traffic originating from different sets of users through different Internet connections (Internet Service Providers), and defining backup routes for defined classes of traffic.

- RTP Header Compression. The Branch Gateway saves up to 60% of the bandwidth necessary using RTP compression. It also enhances the efficiency of voice transmission over the network by compressing the headers of Real Time Protocol (RTP) packets, thereby minimizing the overhead and the delays involved in RTP implementation.

- TCP Header Compression. The Branch Gateway uses Transmission Control Protocol (TCP) header compression to reduce the amount of bandwidth needed for non-voice data. TCP header compression can be applied either as part of RTP Header Compression via IPCH, or using the Van Jacobson method defined in RFC 1144.

- Inter-Gateway Alternate Routing (IGAR). The Branch Gateway uses IGAR as a means to use the PSTN as an alternative to the WAN interface under certain definable conditions. In providing an alternate routing mechanism, IGAR preserves the internal makeup of the call so that the call can be successfully terminated to its original internal destination.
Routing features

Both the G250 and the G350 have an internal router. You can configure the following routing features on the router:

- Interfaces
- Routing table
- VPN
- GRE tunneling
- DHCP and BOOTP relay
- DHCP server
- DHCP client
- Broadcast relay
- ARP table
- ICMP errors
- RIP
- OSPF
- Route redistribution
- VRRP
- Fragmentation
- Static routes
- Policy based routing
- Distribution lists
- Dynamic IP addresses
- DNS resolver
- Unnumbered IP interfaces
- SYN cookies
- Keepalive packets
- Object tracking
- Backup interfaces
Chapter 4: Management

The Avaya G250 and G350 Media Gateways can be managed using any of the following applications:

- Avaya G250 and Avaya G350 Command Line Interfaces
- Avaya G250/G350 Manager and Embedded Web Manager
- Avaya Integrated Management
- Avaya QoS Manager

Avaya G250 and Avaya G350 Command Line Interfaces

You can use the Avaya G250 or Avaya G350 CLI to configure the Branch Gateway and its media modules. The CLI is a textual command prompt interface. It is similar to the CLI of many other network devices.

You can access the CLI with any of the following:

- Telnet through the network
- Telnet through dialup, using a dialup PPP network connection
- A console device connected to the Console port on the Branch Gateway front panel
- SSH (Secure Shell), which enables you to establish a remote session over a secured tunnel

For information about each command in the CLI, see the Avaya G250 and G350 Media Gateway CLI Reference, 03-300437.

For information about how to use the CLI to perform specific configuration tasks, see Administration for the Avaya G250 and Avaya G350 Media Gateway, 03-300436.

Avaya G250/G350 Manager and Embedded Web Manager

The Avaya G250/G350 Manager is a web-enabled graphical administration tool for configuring a single G250 or G350 device. You can use Avaya G250/G350 Manager to configure the G250 or G350 chassis and media modules. You can also use it for status monitoring and troubleshooting. You can open Avaya G250/G350 Manager in one of the following ways:

- From Avaya Integrated Management software
- From a web browser on a computer on the same network as the device (supported by the Avaya G350 only)
For information about the Avaya G250/G350 Manager, see the G250/G350 Manager User Guide, 14-300166.

Avaya Integrated Management

Avaya Integrated Management offers a comprehensive set of web-based network and system management solutions that support Avaya converged voice solutions. You can use Avaya Integrated Management to monitor SNMP traps on the Branch Gateway. You can also use Avaya Integrated Management to access Avaya G250/G350 Manager.

Avaya QoS Manager

You can use Avaya QoS Manager to configure Branch Gateway QoS policy capabilities. You can access Avaya QoS Manager through Avaya Integrated Management software.

Management access permissions

To use any management functions, the user must have a user name and password. Each user name is associated with one of three privilege levels: read-only, read-write, and administrator.
The Avaya G250/G350 Media Gateway provides the following security features:

- **Traffic security features:**
  - Private secure connections can be configured between the G250/G350 and a remote peer, using VPN (Virtual Private Network). VPN at the IP level is deployed using a standards-based set of protocols defined by the IETF called IPSec. IPSec provides privacy, integrity, and authenticity to information transferred across IP networks.
  - Access to the G250/G350’s LAN ports is authenticated using the 802.1x protocol. On the G350, you can enable 802.1x on the MM314 and MM316 media modules’ 10/100 Ethernet ports. On the G250, you can enable 802.1x on the eight Ethernet LAN PoE ports located on the G250’s front panel. The 802.1x protocol standard is extended to support an optional mode for authenticating multiple supplicants.

- **Management security features:**
  - A basic authentication mechanism in which users are assigned privilege levels
  - Support for user authentication provided by external RADIUS server
  - SNMPv3 user authentication
  - Secure data transfer via SSH and SCP with user authentication

- **Protection against DoS (Denial of Service) attacks via:**
  - RSS notifications. The G250/G350 identifies predefined or custom-defined traffic patterns as suspected DoS attacks and generates SNMP notifications, referred to as Remote Security Services (RSS) notifications. RSS notifications are intercepted and, if certain conditions are met, may be forwarded to the Avaya Security Operations Center (SOC) as INADS alarms. The SOC is an Avaya service group that handles DoS alerts, responding as necessary to any DoS attack or related security issue.
  - SYN cookies, which protect against a well-known TCP/IP attack in which a malicious attacker targets a vulnerable device and effectively prevents it from establishing new TCP connections.
Alarms and troubleshooting features

The Branch Gateways have extensive features for error detection, alarms, and troubleshooting. Detailed diagnostic information and troubleshooting are provided by software-based solutions accessible by laptops in the field or remotely from an administrator’s computer. *Administration for the Avaya G250 and Avaya G350 Media Gateway*, 03-300436, provides a comprehensive guide to configuring and using these solutions.

Front panel LEDs

LEDs on the front panel of the G250 and G350 and their media modules give a quick overall understanding of the health of the system and subsystems. When alarms or problems occur, LEDs indicate that a technician’s attention is needed.

Automatic error detection

During normal operations, software or firmware automatically detects and attempts to fix or circumvent error conditions. The system automatically attempts either to fix or circumvent these problems. Errors are detected in two ways:

- Firmware on a system component during ongoing operations
- A “periodic test” or a “scheduled test” started by software

A technician can run more comprehensive tests on demand.

SNMP

The Branch Gateways report alarms using SNMP traps. The G350 fully supports SNMP versions SNMPv1, SNMPv2c, and SNMPv3. The G250 supports SNMPv3 for sending SNMPv1, SNMPv2c, and SNMPv3 traps, but does not support the SNMPv1 trap mechanism.

Packet sniffing

The Branch Gateways feature packet sniffing. All packets, including non-Ethernet packets, that pass through the Branch Gateway, are recorded. The recorded packets are stored in a file that can be uploaded either to the Media Server or to a PC and read by Ethereal for troubleshooting purposes.
VoIP debugging using RTP-MIB

The Branch Gateways include the RTP-MIB feature for debugging QoS-related problems across the VoIP network without any dedicated hardware. During each RTP stream, counters representing various QoS metrics increment whenever configured thresholds for the metrics are exceeded. A limited history of the QoS metric statistics is stored on the Branch Gateway for active and terminated RTP streams. Statistics can be displayed via the G250/G350 CLI. In addition, the Branch Gateway can be configured to send SNMP traps to the SNMP trap manager on the media server at the termination of each RTP stream that has QoS problems. The traps are converted to syslog messages and stored for viewing in the messages file on the media server hard disk.

Object tracking

The Branch Gateways include object tracking. The purpose of Object tracking is to track the state (up/down) of remote devices using keepalive probes, and notify registered applications when the state changes. Object tracking is utilized by applications such as VPN to track remote devices and take certain steps when the state of a remote device changes.

Converged Network Analyzer (CNA) test plug

CNA test plugs are a component of CNA, a distributed system tool for real-time network monitoring that detects and diagnoses converged network-related issues. CNA is deployed in the Branch Gateway to identify any network conditions or impairments that can degrade the user experience for IP telephony and to monitor overall network performance. Test plugs in media gateways provide the ability to measure end-to-end service to the edge of the PSTN, or at points where codec changes are required for interworking between high (LAN) and low (WAN) speed links.

Link Layer Discovery Protocol (LLDP)

LLDP simplifies network troubleshooting and enhances the ability of network management tools to discover and maintain accurate network topologies in multi-vendor environments. LLDP defines a set of advertisement messages (TLVs), a protocol for transmitting the TLVs, and a method for storing the information contained in the received TLVs. This allows stations attached to a LAN to advertise information about the system and about the station’s point of attachment to the LAN to other stations attached to the same LAN. These can be reported to the management station via SNMP MIBs.

On the G250, LLDP is supported on all the Ethernet LAN ports on the chassis.

On the G350, LLDP is supported on the Ethernet LAN ports located on the MM314 and MM316 media modules.
Chapter 5: Documentation

The following documentation is available to help you implement the Branch Gateway (G250 or G350) in your environment:

- *Installing and Upgrading the Avaya G250 Media Gateway*, 03-300434. Describes how to install and upgrade the G250, prepare the G250 for software configuration, and perform some basic configurations. This guide describes how to insert media modules and connect external devices to the G250 and media module ports.

- *Installing and Upgrading the Avaya G350 Media Gateway*, 03-300394. Describes how to install and upgrade the G350, prepare the G350 for software configuration, and perform some basic configurations. This guide describes how to insert media modules and connect external devices to the G350 and media module ports.

- *Quick Start for Hardware Installation for the Avaya G250 Media Gateway*, 03-300433. A concise installation guide covering assembly and basic configuration of the G250.

- *Quick Start for Hardware Installation for the Avaya G350 Media Gateway*, 03-300148. A concise installation guide covering assembly and basic configuration of the G350.

- *Administration for the Avaya G250 and Avaya G350 Media Gateway*, 03-300436. Describes how to configure and manage the Branch Gateways after it is already installed. This guide contains detailed information about all the features of the Branch Gateways and how to implement them.

- *Avaya G250 and G350 Media Gateway CLI Reference*, 03-300437. Describes the commands in the G250/G350 CLI.

- *Maintenance Alarms for Avaya Communication Manager 4.0, Media Gateways and Servers*, 03-300430. Describes MOs and how to resolve alarms.

- *Maintenance Commands for Avaya Communication Manager 4.0, Media Gateways and Servers*, 03-300431. Describes all the commands across platforms.

- *Maintenance Procedures for Avaya Communication Manager 4.0, Media Gateways and Servers*, 03-300432. Describes maintenance procedures such as network recovery.
## Appendix A: G250 and G350 capacities

### G250 maximum media gateway capacities

**Table 12: G250 media gateway capacities**

<table>
<thead>
<tr>
<th>Description</th>

G250 and G350 capacities
Appendix B: Supported Avaya products

There are various Avaya telephones supported by the Branch Gateways (G250 and G350), including IP, DCP digital, and analog telephones.

Avaya IP telephones

The Branch Gateways support the following Avaya IP telephones:

- Avaya 4602 IP Telephone
- Avaya 4602SW IP Telephone
- Avaya 4601 IP Telephone
- Avaya 4606 IP Telephone
- Avaya 4610 IP Telephone
- Avaya 4612 IP Telephone
- Avaya 4620 IP Telephone
- Avaya 4624 IP Telephone
- Avaya 4630 IP Screenphone
- Avaya 4630SW IP Screenphone
- Avaya 4690 IP Telephone

Note:
The Avaya 4630 IP and 4630SW IP Screenphones cannot be powered via PoE ports.

Avaya DCP digital telephones

The G250-DCP and the DCP media modules supported by the G350 support the following DCP telephones:

Note:
The G250 does not support DCP media modules, although the G250-DCP includes DCP ports on its chassis.

- Avaya 2402 Digital Telephone
- Avaya 2420 Digital Telephone
- Avaya 6402 and Avaya 6402D Digital Telephones
- Avaya 6408 and Avaya 6408D+ Digital Telephones
Supported Avaya products

- Avaya 6416 and 6416D+M Digital Telephone
- Avaya 6424 and 6424D+M Digital Telephone
- Avaya 8410D Digital Telephone
- Avaya 8434DX Digital Telephone
- Definity Extender – Analog single endpoint
- Definity Extender – ISDN single endpoint
- 302 series Attendant Console (302D)
- Avaya 603E Call Master III
- Avaya 603F Call Master IV
- Avaya 607A Call Master V
- Avaya 606B1 Call Master VI
- Avaya eConsole R1 (PC Console R3 with 8411 digital telephone)
- Avaya IP eConsole

Avaya analog telephones

The Branch Gateways support the following Avaya analog telephones:

- Avaya 6211 Analog Telephone
- Avaya 6219 Analog Telephone
- Avaya 2500 and the Avaya 2554 Analog Terminals
- 2520 Explosive Atmosphere Telephone
Appendix C: G250 technical specifications

The G250 technical specifications include physical dimensions and tolerances of the Avaya G250 Media Gateway, power cord specifications and media module specifications.

G250 specifications

The table of technical specifications provides detailed information on the physical dimensions and tolerances of the Avaya G250 Media Gateway:

G250 power cord specifications

For North America: The cord set must be UL Listed/CSA Certified, 16 AWG, 3-conductor (3rd wire ground), type SJT. One end is to be terminated to an IEC 60320, sheet C13 type connector rated 10A, 250V. The other end is to be terminated to either a NEMA 5-15P attachment plug for nominal 125V applications or a NEMA 6-15P attachment plug for nominal 250V applications.

For Outside North America: The cord must be VDE Certified or Harmonized (HAR), rated 250V, 3-conductor (3rd wire ground), 1.0 mm² minimum conductor size. The cord is to be terminated at one end to a VDE Certified/CE Marked IEC 60320, sheet C13 type connector rated 10A, 250V and the other end to a 3-conductor grounding type attachment plug rated at a minimum of 10A, 250V and a configuration specific for the region/country in which it will be used. The attachment plug must bear the safety agency certifications mark(s) for the region/country of installation.

G350 power cord specifications

For North America: The cord set must be UL Listed/CSA Certified, 16 AWG, 3-conductor (3rd wire ground), type SJT. One end is to be terminated to an IEC 60320, sheet C13 type connector rated 10A, 250V. The other end is to be terminated to either a NEMA 5-15P attachment plug for nominal 125V applications or a NEMA 6-15P attachment plug for nominal 250V applications.

For Outside North America: The cord must be VDE Certified or Harmonized (HAR), rated 250V, 3-conductor (3rd wire ground), 1.0 mm² minimum conductor size. The cord is to be terminated at one end to a VDE Certified/CE Marked IEC 60320, sheet C13 type connector rated 10A, 250V and the other end to a 3-conductor grounding type attachment plug rated at a minimum of 10A, 250V and a configuration specific for the region/country in which it will be used. The attachment plug must bear the safety agency certifications mark(s) for the region/country of installation.
