Abstract

These Application Notes describe the configuration steps required for IPC Alliance MX 15.03 to interoperate with Avaya Aura® Communication Manager 6.3, Avaya Aura® Session Manager 6.3, and Avaya Modular Messaging 5.2 in a centralized messaging environment.

IPC Alliance MX is a trading communication solution. In the compliance testing, IPC Alliance MX used E1 QSIG trunks to Avaya Aura® Communication Manager, for IPC turret users to obtain voice messaging services from Avaya Modular Messaging. SIP trunks were used from Avaya Aura® Communication Manager to Avaya Aura® Session Manager to reach Avaya Modular Messaging. The Avaya Modular Messaging system in the Central site supported local subscribers from Avaya Aura® Communication Manager at the Central site, and from IPC turret users at the Remote site.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.
1. Introduction

These Application Notes describe the configuration steps required for IPC Alliance MX 15.03 to interoperate with Avaya Aura® Communication Manager 6.3, Avaya Aura® Session Manager 6.3, and Avaya Modular Messaging 5.2 in a centralized messaging environment.

IPC Alliance MX is a trading communication solution. In the compliance testing, IPC Alliance MX used E1 QSIG trunks to Avaya Aura® Communication Manager, for IPC turret users to obtain voice messaging services from Avaya Modular Messaging. SIP trunks were used from Avaya Aura® Communication Manager to Avaya Aura® Session Manager to reach Avaya Modular Messaging. The Avaya Modular Messaging system in the Central site supported local subscribers from Avaya Aura® Communication Manager at the Central site, and from IPC turret users at the Remote site.

2. General Test Approach and Test Results

The feature test cases were performed manually. Calls were manually established among IPC turret users with Avaya SIP, Avaya H.323, PSTN users, and/or the Avaya Modular Messaging voicemail pilot to verify various call scenarios. The Avaya Modular Messaging Web Subscriber Options web-based interface was used to configure subscriber features such as Call Me.

The serviceability test cases were performed manually by disconnecting and reconnecting the E1 connection to IPC Alliance MX.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member’s solution.

2.1. Interoperability Compliance Testing

The interoperability compliance test included feature and serviceability testing.

The feature testing included subscriber login, greeting, voice message, message waiting indicator, call forward, multiple call forward, personal operator, auto attendant, find me, call me, call sender, and transfer.

The serviceability testing focused on verifying the ability of IPC Alliance MX to recover from adverse conditions, such as disconnecting/reconnecting the E1 connection to IPC Alliance MX.
2.2. Test Results
All test cases were executed and passed. The following observations were made from the compliance testing.

- IPC does not offer the Coverage feature, therefore coverage to voicemail for the turret users were accomplished by setting the Modular Messaging pilot number as the Call Forwarding destination for the users.

- During For multiple call forward scenarios involving calls forwarded to the called party’s forward-to extension and then covered subsequently to Modular Messaging based on the coverage setting at the forward-to extension, the call does not get the called party greeting, instead, it keeps ringing at the forward-to station.

2.3. Support
Technical support on IPC Alliance MX can be obtained through the following:

- **Phone:** (800) NEEDIPC, (203) 339-7800
- **Email:** systems.support@ipc.com
3. Reference Configuration

As shown in the reference configuration below, IPC Alliance MX at the Remote Site consisted of the Alliance MX, System Center, and Turrets. E1 QSIG trunks were used from IPC Alliance MX to Avaya Aura® Communication Manager, and SIP trunks were used from Avaya Aura® Communication Manager to Avaya Aura® Session Manager to reach Avaya Modular Messaging. In the test configuration, QSIG allowed IPC turret users at the Remote Site to “cover” to Avaya Modular Messaging at the Central site for voice messaging services.

The configuration of Avaya Aura® Session Manager is performed via the web interface of Avaya Aura® System Manager. The detailed administration of basic connectivity among Avaya Aura® Communication Manager, Avaya Aura® Session Manager, and Avaya Modular Messaging is not the focus of these Application Notes and will not be described. These Application Notes will focus on the additional configuration required to support IPC turret users as local subscribers on Avaya Modular Messaging.

The detailed administration of E1 QSIG trunks between Avaya Aura® Communication Manager and IPC Alliance MX, to enable IPC turret users to reach users on Avaya Aura® Communication Manager and on the PSTN, is assumed to be in place with details described in [3]. A five digit Uniform Dial Plan (UDP) was used to facilitate dialing between the Central and Remote sites. Unique extension ranges were associated with Avaya Aura® Communication Manager user(s) at the Central site (72xxx), and IPC turret users at the Remote site (33xxx). The Avaya Modular Messaging pilot number was 7777.

5. Configure Avaya Aura® Communication Manager

For a QSIG trunk configuration between Communication Manager and IPC Alliance, please refer to [3]. Otherwise, there is no special configuration in Communication Manager.
6. Configure Avaya Modular Messaging MSS

This section provides the procedures for configuring IPC turret users as local subscribers on Avaya Modular Messaging. The subscriber management is configured on the Messaging Storage Server (MSS) component. The configuration procedures include the following areas:

- Launch messaging administration
- Administer subscriber extension ranges
- Administer subscribers

6.1. Launch Messaging Administration

Access the MSS web interface by using the URL [http://ip-address](http://ip-address) in an Internet browser window, where “ip-address” is the IP address of the MSS server. The Logon screen is displayed. Log in using a valid user name and password. The Password field will appear after a value is entered into the Username field.
The **Messaging Administration** screen appears, as shown below.

6.2. Administer Subscriber Extension Ranges

Select **Messaging Administration → Networked Machines** from the left pane, to display the **Manage Networked Machines** screen. Select the MSS server from the table listing, and click **Edit the Selected Networked Machine** toward the bottom right of the screen.
The **Edit Networked Machine** screen is displayed. Under the **MAILBOX NUMBER RANGES** sub-section, locate an available entry line and enter the desired starting and ending mailbox numbers to be used for the IPC subscribers as necessary. In the compliance testing, the existing entry covered the 33xxx extensions used by the IPC turret users.
6.3. Administer Subscribers

Select **Messaging Administration** → **Subscriber Management** from the left pane, to display the **Manage Subscribers** screen. For the **Local Subscriber Mailbox Number** field toward the top of the screen, enter the first IPC turret user extension to add as a local subscriber, in this case “33309”. Click **Add or Edit**.
The **Add Local Subscriber** screen is displayed next. Enter the desired string into the **Last Name**, **First Name**, and **Password** fields.

In the compliance testing, the same telephone extensions for the IPC subscribers were used for the **Mailbox Number**, **Numeric Address**, **PBX Extension**, and **Email Handle** fields. Select the appropriate **Class Of Service**, and retain the default values in the remaining fields. Repeat this section to add all IPC subscribers.
7. Configure Avaya Aura® Session Manager

This section provides the procedures for configuring Avaya Aura® Session Manager. The procedures include the following areas:

- Launch System Manager
- Administer dial patterns

7.1. Launch System Manager

Access the System Manager web interface by using the URL http://ip-address in an Internet browser window, where “ip-address” is the IP address of the System Manager server. Log in using the appropriate credentials.

![Avaya Aura® System Manager 6.3](image-url)
7.2. Administer Dial Patterns

Select Routing ➔ Dial Patterns (not shown) from the left pane, and click New in the subsequent screen (not shown) to add a new dial pattern for Modular Messaging to reach IPC turret users.

The Dial Pattern Details screen is displayed. In the General sub-section, enter the following values for the specified fields, and retain the default values for the remaining fields.

- **Pattern:** A dial pattern to match.
- **Min:** The minimum number of digits to be matched.
- **Max:** The maximum number of digits to be matched.
- **SIP Domain:** Select the applicable domain for the relevant Communication Manager.
- **Notes:** Any desired description.

In the Originating Locations and Routing Policies sub-section, click Add and create a dial pattern for reaching IPC turret users with extensions 33xxx. In the compliance testing, the policy allowed for call origination from all location, and the destination is Communication Manager, as shown below. Retain the default values in the remaining fields. Modular Messaging will dial out to IPC turret users for features such as Call Sender, and the call will be delivered as SIP from Modular Messaging to Session Manager, and SIP from Session Manager to Communication Manager, and then QSIG from Communication Manager to Alliance MX.
The following screen shows the dial pattern for the pilot number, 7777, to Modular Messaging.
8. Configure IPC Alliance MX
For the compliance test, no special configuration is needed for the IPC Alliance MX. For a QSIG trunk configuration between Communication Manager and IPC Alliance, please refer to [3].

9. Verification Steps
This section provides the tests that can be performed to verify proper configuration of Avaya Aura® Communication Manager, Avaya Modular Messaging, Avaya Aura® Session Manager, and IPC Alliance MX.

Place a call from an IPC turret user to the Modular Messaging pilot number. Verify that Modular Messaging recognizes the calling party as a local subscriber.

10. Conclusion
These Application Notes describe the configuration steps required for IPC Alliance MX 15.03 to successfully interoperate with Avaya Modular Messaging 5.2 and Avaya Aura® Session Manager 6.3 in a centralized messaging environment using QSIG trunks to Avaya Aura® Communication Manager 6.3. All feature and serviceability test cases were completed with an observation noted in Section 2.2.
