Warranty Information

Software and Hardware Limited Warranties

Lucent Technologies provides a 90-day limited software warranty, and a one-year limited hardware warranty on this product. Refer to the Software License and Limited Warranty Agreement and the Lucent Technologies InterNetworking Systems Global Warranty that accompanied your package for more information.

Every effort has been made to ensure that this document is complete and accurate at the time of release, but information is subject to change. Lucent Technologies assumes no responsibility or liability for errors or inaccuracies that may appear in this guide.
Warranty Warnings

⚠️ CAUTION:
Do not make electrical or mechanical modifications to any of the components in the PSAX system. Lucent Technologies is not responsible for the safety or the performance of a modified Lucent product. Do not attempt to repair any failed Power Supply module, Stratum 3–4 module, CPU module, I/O, or Server module.

⚠️ CAUTION:
Do not make electrical or mechanical modifications to any of the components in the PSAX system. Lucent Technologies is not responsible for the safety or the performance of a modified Lucent product. Do not attempt to repair any failed removable I/O or server modules.

⚠️ CAUTION:
Modifying or tampering with PSAX chassis components may void your warranty. Any modification to this equipment not expressly authorized by Lucent Technologies may void your granted authority to operate such equipment.

⚠️ CAUTION:
Air vents in the PSAX chassis are provided to aid in ventilation and to protect from overheating. These vents must be regularly inspected by the user and cleared of dust and blockage. Equipment failure associated with improper maintenance or suspected failure to adhere to proper ventilation procedures as described above will void your warranty.

⚠️ CAUTION:
You must replace an air filter having an accumulation of dust to ensure adequate airflow through the PSAX chassis. Reduced airflow could result in damaging heat buildup within the chassis.

- Periodically inspect the air filter for accumulated dust and replace the filter as needed. At a minimum, monthly inspection is recommended. Equipment failure due to inadequate airflow voids your equipment warranty.
- Use only filters supplied by Lucent Technologies in your PSAX chassis. Use of other filters voids your equipment warranty.

⚠️ CAUTION:
You must maintain a minimum 10.16 cm (4 in) of clearance around the chassis for adequate airflow. Failure to adhere to this space requirement may result in equipment failure due to overheating. Failure to provide a minimum of 10.16 cm (4 in) of clearance between this unit and any other device/structure will void your warranty.
CAUTION:
If your system or location loses power or your current session ends abnormally while you are in the process of configuring the system, and you have not yet saved the values permanently, you will lose all unsaved values you have applied on the various windows.

CAUTION:
Shipping the chassis with removable modules installed may cause damage to the chassis and the modules. Damage to any of the components in the system resulting from shipping the chassis with removable modules installed could void your warranty. Only Lucent-authorized personnel should ship the PSAX 2300 chassis with a module installed.

Regulatory Standards Compliance

The PSAX 2300 Access Concentrator is fully compliant with the following environmental, safety, and emissions standards. Appropriate statements appear in the next subsection.

Safety Requirements

- Underwriter’s Laboratory (UL) — Safety and Factory Compliance
  UL 1950

Electromagnetic Compatibility (EMC) and Physical Requirements

- Federal Communications Commission (FCC) — EMC compliance (Part 15 Class A)
- Network Equipment Building System (NEBS) GR-63-CORE and GR-1089-CORE, Level 3 requirements
- EN 300 386-2 Class A
- VCCI Class A

CE Marking

CE marking of the Lucent Technologies PSAX 2300 ATM Access Concentrator consisting of the following model numbers:
Copyright and Legal Notices

Regulatory Statements

is based upon conformity with the following standard(s) or other normative document(s):

• EN 300 386-2:1997
• EN 55022:1994 Class A
• CTR 4/A1 as specified in Commission Decision 98/520/EC
• CTR 12/A1 as specified in Commission Decision 97/520/EC
• CTR 13 as specified in Commission Decision 97/521/EC
• CTR 24 as specified in Commission Decision 97/639/EC

in accordance with the provisions of the following Council directives:

• Electromagnetic Compatibility (EMC) 89/336/EEC
• Low Voltage 73/23/EEC
• Telecommunications Terminal Equipment and Satellite Earth Station Directive 98/13/EC

The European Community Declarations of Conformity for the PSAX 2300 Access Concentrator are included in the EC Declarations of Conformity Appendix in the back of this guide.

![CE 168X](image)

Regulatory Statements

United States Federal Communications Commission (FCC) Statements

Part 15. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy, and, if not installed and used in accordance with this guide, may cause harmful interference to radio communications. Operation of this equipment in a
residential area is likely to cause harmful interference; in this case, you would be required to correct the interference at your own expense.

All cables used to connect to peripherals must be shielded and grounded. Operation with cables, connected to peripherals, that are not shielded and grounded may result in interference to radio and television reception.

The user is cautioned that any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

**Part 68.** This equipment complies with Part 68 of the FCC rules. On the back of the PSAX 2300 chassis is a label that contains the FCC registration number, in addition to other information. You must provide this information to the telephone company, if they request it. The FCC requires Lucent Technologies, Inc., to provide you with the following information:

1. The PSAX 2300 system has digital service interface capabilities using RJ-48C and RJ-48H connectors. The facility interface codes with which the PSAX 2300 system complies for digital services are as follows: 04DU9-BN, 04DU9-DN, 04DU9-1KN, and 04DU9-1SN. The PSAX 2300 system has loop start interface capabilities using an RJ-11C connector. The facility interface code with which the PSAX 2300 system complies for service is 02LS2. The service order codes for the PSAX 2300 system are 6.0F for the T-1 interface and 9.0Y for the loop start interface.

2. An FCC-compliant telephone network interface jack is built into this equipment and is compatible with interconnections that are Part 68 compliant.

3. The REN for the Voice 2-Wire Office module when used in the PSAX 2300 system is 0.7B.

4. If the PSAX 2300 system causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service might be required. But if advance notice is not practical, the telephone company will notify you as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe this is necessary.

5. The telephone company might make changes in its facilities, equipment, operations, or procedures that could affect the operation of this equipment. If this happens, the telephone company will provide advance notice for you to make necessary modifications to maintain uninterrupted service.

6. If you experience trouble with the PSAX 2300 system, or need repairs or warranty information, please refer to the Limited Hardware Warranty card that accompanied your PSAX 2300 product shipment for instructions on obtaining technical support in your area. If the PSAX 2300 system is causing harm to the telephone network, the telephone company might request that you disconnect the equipment until the problem is resolved.

7. This equipment has no user-serviceable parts.
This equipment cannot be used on public coin telephone service provided by the telephone company. Connection to party line service is subject to state tariffs. Contact your state public utility commission, public service commission, or corporation commission for information.

Canadian Regulatory Statements

**Ringer Equivalence Number (REN) Notice.** The Industry Canada label identifies certified equipment. This certification means that the equipment meets certain telecommunications network protective, operational, and safety requirements. The Department does not guarantee that the equipment will operate to the user’s satisfaction.

Before installing this equipment, the user should ensure that it is permissible to be connected to the facilities of the local telecommunications company. The equipment must also be installed by using an acceptable method of connection. In some cases, the company's inside wiring associated with a single-line individual service may be extended by means of a certified connector assembly (telephone extension cord). The customer should be aware that compliance with the above condition may not prevent degradation of service in some situations.

Repairs to some certified equipment should be made by an authorized maintenance facility designated by the supplier. Any repairs or alternations made by the user to this equipment or equipment malfunctions might give the telecommunications company cause to request the user to disconnect the equipment.

For their own protection, users should ensure that the ground connections of the power utility, telephone lines, and internal metallic water pipe system are connected together. This precaution may be particularly important in rural areas.

⚠️ **CAUTION:**

Users should not attempt to make such connections themselves, but should contact the appropriate electric inspection authority or electrician.

The Ringer Equivalence Number (REN) assigned to the Voice 2-Wire Office module denotes the percentage of the total load to be connected to a telephone loop, which is used by the device, to prevent overloading. The termination on a loop may consist of any combination of devices subject only to the requirement that the total of the REN of all devices does not exceed 5.

The REN for the Voice 2-Wire Office module when used in the PSAX 2300 system is 0.7B.
homologation indique que l’équipement satisfait certaines règles de protection, d’exploitation et de sécurité des réseaux de télécommunications. Le ministère de l’Industrie ne garantit pas que l’équipement fonctionnera à la satisfaction de l’utilisateur.

Avant d’installer cet équipement, l’utilisateur doit s’assurer qu’il est permis de le connecter aux installations de la compagnie de télécommunications locale. L’équipement doit également être connecté suivant une méthode convenable. Dans certains cas, il sera nécessaire de prolonger le câblage intérieur de la ligne d’abonné de la compagnie au moyen d’un connecteur homologué (rallonge de téléphone). L’abonné doit savoir que, dans certaines situations, la conformité aux dispositions ci-dessus ne prévient pas nécessairement la dégradation du service.

La réparation de certains équipements homologués doit être assurée par un atelier agréé désigné par le fournisseur. Toute réparation ou altération effectuée par l’utilisateur ou tout mauvais fonctionnement de cet équipement peut donner à la compagnie de téléphone des raisons de demander audit utilisateur de déconnecter celui-ci.

Pour leur propre sécurité, les utilisateurs doivent veiller à ce que les mises à la terre de l’alimentation secteur, des lignes téléphoniques et du système intérieur de conduites d’eau métalliques soient raccordés ensemble. Cette précaution peut s’avérer particulièrement importante dans les zones rurales.

⚠️ CAUTION:

Les utilisateurs ne doivent pas tenter d’effectuer eux-mêmes ces raccordements, mais doivent prendre contact avec un électricien ou organisme de vérification compétent.

Le nombre équivalent de sonnerie (REN) attribué au module central bifilaire (Voice 2-Wire Office) correspond au pourcentage de la charge totale à connecter à un circuit téléphonique bifilaire; il est utilisé par l’appareil pour prévenir la surcharge. Le circuit peut être terminé par n’importe quelle combinaison d’appareils, à la seule condition que le total des REN de ces derniers ne dépasse pas cinq.

International Regulatory Statements

CISPR22. This is a Class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

Australian/New Zealand Regulatory Statements

AS/NZS-3548 Warning. This is a Class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.
Japanese Regulatory Statement

**Voluntary Control Council (VCCI) Class A Regulatory Statement.** This is a Class A product based on the standard of the Voluntary Control Council for Interference by Information Technology Equipment (VCCI). If this equipment is used in a domestic environment, radio disturbance may occur, in which case, the user may be required to take corrective actions.

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要請されることがあります。
Safety Information

When installing and operating the PSAX 2300 Access Concentrator, follow the safety guidelines provided below to help prevent serious injury and/or damage to the PSAX 2300 equipment. Please read all warnings and instructions supplied before beginning installation or configuration of the PSAX 2300 equipment. In addition to the general safety information provided below, you should also refer to the text in the user and installation guides for other important safety information and procedures.

⚠️ DANGER:
Never push and/or place an object in or through any vent in the PSAX 2300 chassis. Doing so may result in personal injury, equipment damage, or both. Touching exposed electrical components may cause injury.

⚠️ DANGER:
Install only equipment identified in the installation guide for the PSAX 2300 system. Using other equipment may result in improper connection of circuitry, which may lead to equipment fire, personal injury, or equipment damage.

⚠️ DANGER:
Do not install or use the PSAX 2300 unit in wet locations. In the event the unit becomes wet, turn it off, disconnect it from the facility power source, and allow the unit to dry thoroughly. If, after this procedure, you encounter problems with the performance of the unit, please contact your NetworkCare Service Center. (See the Lucent Technologies InterNetworking Systems Global Warranty that accompanied your shipment for the appropriate telephone number.)

⚠️ DANGER:
Ensure that the voltage and frequency of the facility power source match the requirements of the PSAX 2300 Power Supply unit. The PSAX 2300 system should only be operated from the power source type indicated on the marking label. Failure to meet this requirement may cause personal injury, fire, and/or damage to the unit.

⚠️ DANGER:
The OC-3c Single Mode (SM) and the STM-1 Single Mode (SM) modules contain a laser-generating device, which emits a laser light beam from the transmit port. This port is labeled TX on the module faceplate. When the module is inserted into an operational PSAX 2300 chassis, personal injury may result from looking into, or near, either port. Personal injury may also result from looking into, or near, the far end of a connected fiber optic cable. For additional laser safety information, see Appendix B.

⚠️ DANGER:
Interface lines connected to the Voice 2-Wire Office module (model number 20N32) that exit the building premises must be connected to any nationally recognized testing laboratory (NRTL) listed telecommunications protection device that provides primary and secondary protection. These protection devices provide overvoltage protection to the Voice 2-Wire Office module interface lines.

⚠️ DANGER:
Direct current (DC) power supplies must be installed only in restricted areas (dedicated equipment rooms, equipment closets, or the like), in accordance with Articles 110-16, 110-17, and 110-18 of the National Electric Code, ANSI/NFPA 70. Connect to a -48 Vdc source that is electrically isolated from the alternating-current (AC) source and reliably grounded to the earth.

This equipment is designed to permit the connection of the grounded conductor of the direct-current supply circuit to the grounding conductor on the equipment. If this connection is made, all of the following conditions must be met:
• This equipment shall be connected directly to the direct-current supply system grounding electrode conductor, the bonding jumper from a grounding terminal bar, or a bus to which the direct-current supply system grounding electrode conductor is connected.
• This equipment shall be located in the same immediate area (such as adjacent cabinets) as any other equipment that has a connection between the grounded conductor of the same direct-current supply circuit and the grounding conductor, and also has the point of grounding of the direct-current system. The direct-current system shall not be grounded elsewhere.
• The direct-current supply source must be located within the same premises as the equipment.
• There shall be no switching or disconnecting devices in the grounded circuit conductor between the direct-current source and the point of connection of the grounding electrode conductor.

⚠️ DANGER:
A readily accessible disconnect device must be provided in the fixed wiring for a direct-current Power Supply. It must be suitable for the rated voltage and current specified in the PSAX 2300 installation guide.

⚠️ DANGER:
When installing the unit, the ground connection must always be initiated first and disconnected last.
Safety Information

⚠️ DANGER:
Read all installation instructions before connecting the system to a power source.

⚠️ DANGER:
This equipment is to be properly grounded prior to operation. Ensure the PSAX 2300 chassis is properly grounded during normal use.

⚠️ DANGER:
Wire the direct-current power supply using the appropriate lugs at the wiring end, as shown in the illustration of the direct-current Power Supply terminal block in the installation guide for the PSAX 2300 system. The proper wiring sequence is ground to ground, positive to positive (line to L), and negative to negative (neutral to N). Before servicing direct-current supply voltages, ensure the power is removed from the direct-current circuit. To ensure all power is OFF, locate the circuit breaker on the panel board that services the direct-current circuit, switch the circuit breaker to the OFF position, and tape the switch handle to the circuit breaker in the OFF position. After wiring the direct-current Power Supply, remove the tape from the circuit breaker switch handle and reinstate power by moving the handle of the circuit breaker to the ON position.

⚠️ DANGER:
Do not work on the system, connect, or disconnect cables during periods of possible lightning activity.

⚠️ DANGER:
Do not perform any action that could create a possible hazard to others or make the working environment and/or the equipment unsafe.

⚠️ DANGER:
Locate the emergency power-OFF switch for the location in which work is being performed so, in the event an electrical accident occurs, power can be turned off quickly.

⚠️ WARNING:
When using the PSAX product with a PBX and/or Key Telephone System, our system and your equipment must use a common chassis ground connection to avoid ground current loops.

⚠️ WARNING:
Be sure to cover all empty slots with blank faceplates to protect your equipment.

⚠️ WARNING:
When stranded wiring is required, use approved wiring terminations, such as closed-loop or spade-type with upturned lugs. These terminations should be the appropriate size for the wires and should clamp both the insulation and conductor.
\section*{Safety Information}

\begin{itemize}
\item **WARNING:**
Once the PSAX 2300 chassis is operational (power is applied to the chassis) and the OC-3c SM or STM-1 SM module is fully inserted into the chassis backplane, use extreme caution during removal of the fiber optic cable from one or both ports. Keep the protective port caps supplied with these two types of modules nearby (for example, taped to the cable for the port), and place said cap on the port immediately after removing the cable from an operational module.

\item **WARNING:**
If you place the PSAX 2300 chassis on or near the floor, dust or debris may accumulate faster inside the chassis than it would if placed on a table or standing structure. Therefore, if this unit is placed on or near the floor, accelerated routine vent and air filter inspection is necessary to avoid the risk of unit failure and/or injury to property or persons.

\item **WARNING:**
Be sure to use the ejector handles during installation and removal of I/O and server modules.

\item **WARNING:**
When inserting modules into the chassis, slide them gently, not forcefully. Excessive force may cause the modules to be seated improperly in the chassis, and result in possible damage to the module or the chassis.

\item **WARNING:**
Electrostatic discharge (ESD) can damage module and chassis components. All personnel should be grounded and follow proper ESD procedures before installing, removing, or handling PSAX 2300 components.

\item **WARNING:**
The AC power cord is rated at 125 V ac. If you will be using this unit in an application above 125 V ac, you must source an appropriate Agency-approved cordset.

\item **WARNING:**
You must maintain the minimum 10.16 cm (4 in) of clearance on both sides of the chassis for adequate airflow, or the equipment might fail due to overheating. If you place the unit on or near the floor, dust will accumulate faster inside the chassis.

\item **WARNING:**
Interface lines connected to the Voice 2-Wire Station module must be connected only to telephone sets. Do not connect these station port interface lines to Public Switched Telephone Network (PSTN) type interfaces.
\end{itemize}
CAUTION:
If your system or location loses power or your current session ends abnormally while you are in the process of configuring the system, and you have not yet saved the values permanently, you will lose all unsaved values you have applied on the various windows.

CAUTION:
Ultimate disposal of this product should be handled according to all laws and regulations in your specific geographic region.

CAUTION:
Install or remove modules one at a time. Doing this aids in preventing the PSAX 2300 system from indicating any erroneous failure messages, and allows the PSAX 2300 system to reinitialize and display the accurate configuration of the module that is inserted.

CAUTION:
When using a DSP2A, DSP2B or DSP2C Voice Server module and an Enhanced DS1/E1 module with a PBX and/or Key Telephone System, the PSAX 2300 system and your equipment must use a common chassis ground connection to avoid ground current loops, which could affect voice quality.

Installation Checklist

This section provides an overview of the tasks you must complete to install the PSAX 2300 system. Use the following installation checklist to help you install your equipment. Details on system installation follow this checklist.

**Note:** Be sure to take notes on your installation process, results, and any problems associated with your installation of the PSAX 2300 system. Additional space is provided at the end of this checklist for notes.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Your Notes/Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Before You Start Installation:</strong></td>
<td></td>
</tr>
<tr>
<td>1. Read all installation instructions before proceeding. Be sure you understand and follow the safety precautions provided in “Safety Information” on page xi.</td>
<td>☐</td>
</tr>
<tr>
<td>2. Ensure that you have a master network design plan to use for connecting cabling between the PSAX 2300 system and your other network equipment.</td>
<td>☐</td>
</tr>
<tr>
<td>3. Select a location that:</td>
<td></td>
</tr>
<tr>
<td>~ Accommodates the weight and size of the PSAX 2300 system</td>
<td>☐</td>
</tr>
<tr>
<td>~ Offers adequate ventilation and a controlled climate</td>
<td>☐</td>
</tr>
<tr>
<td>4. Verify that the input power from your facility power source meets the specifications in Table 13 on page 20.</td>
<td>☐</td>
</tr>
<tr>
<td>5. Ensure that a fuse panel is already installed in the rack cabinet or telco frame, according the procedures implemented for your facility</td>
<td>☐</td>
</tr>
<tr>
<td>6. Determine whether the rack or cabinet in which you are installing the PSAX 2300 system is connected to a common ground.</td>
<td>☐</td>
</tr>
</tbody>
</table>

Additional Notes

Use this page for additional notes about the process, results, and any problems associated with your installation of the PSAX 2300 system.
About This Guide

Purpose of This Guide

The *PSAX 2300 Access Concentrator Installation and Operation Guide* provides information about the following:

- Observing appropriate safety, electrostatic discharge (ESD), and ventilation precautions in setting up and operating the PSAX 2300 Access Concentrator (PSAX 2300) system
- Setting up your hardware components in preparation for installation
- Installing your PSAX 2300 chassis and related hardware
- Installing user-selected input/output (I/O) and server modules into the PSAX 2300 chassis
- Starting up the PSAX 2300 system
- Running system checkout tests on the PSAX 2300 system
- Shutting down the PSAX 2300 system
- Removing modules from the installed PSAX 2300 system

**Note:** If you are installing a new, unconfigured system for the first time, you should read through this guide before beginning the installation process.

Audience for This Guide

The information in this guide is intended for people who will install the PSAX 2300 system hardware.

Before you use this document or operate the PSAX 2300 chassis you should already understand and have experience with the following:

- Electrical safety and electrical installation techniques and procedures
- General installation of communications hardware

Only authorized personnel should use the Access Concentrator system.

Technical Support

Follow all safety guidelines in this document to help prevent personal injury to you and damage to the PSAX 2300 Access Concentrator system equipment. Refer to the procedures within this installation guide for important safety information and proper procedures.

Standard icons and symbols to alert you to dangers and cautions are listed below.

⚠️ **DANGER:**
Warnings for a general personal injury hazard are identified by this format.

⚠️ **WARNING:**
Warnings relating to risk of equipment damage or failure are identified by this format.

⚠️ **CAUTION:**
Warnings relating to risk of data loss or other general precautionary notes are identified by this format.

**Note:** Identifies additional information pertinent to the text preceding this note.

Technical Support

If you experience a problem with your PSAX 2300 system, refer to the *Lucent Technologies InterNetworking Systems Global Warranty* card that accompanied
your PSAX 2300 product shipment for instructions on obtaining support in your area.

About Lucent Technologies

History

Lucent Technologies is the communications systems and technology company formed through the restructuring of AT&T. We bring with us a tradition of more than 125 years of experience and a dedication to superior customer service.

Lucent Technologies manufactures, sells, and services a complete line of customer premises communications units, and commercial and multimedia communications and messaging systems designed and supported by our research and development unit, Bell Laboratories.

Our legacy and our spirit of innovation allow Lucent to provide our customers with the tools needed to communicate effectively, any time and anywhere, and to integrate the latest technologies into real-life solutions that help make business work.

For More Information

To learn more about the PacketStar™ family of ATM Multiservice Access Concentrators and the complete line of Lucent Technologies products, visit our Web site at www.lucent.com.

About the PacketStar™ PSAX Product Family

Lucent’s PacketStar™ PSAX family provides a complete range of multiservice access concentrators, as described in Table 4.

This manual applies to the PSAX 2300 only. For details on installing, operating, or managing other PSAX equipment, see the appropriate guides for those chassis.

About This Guide
About Lucent Technologies

PacketStar™ PSAX 15 The PacketStar PSAX 15 offers a low-speed T-1/E-1 integrated access option, especially for AAL-2 voice-focused applications.
A scalable, multiservice access concentrator for enterprise applications, the PacketStar PSAX 15 optimizes wide area network (WAN) bandwidth with toll-quality voice compression, traffic optimization, and port scalability from T-1/E-1 to OC-3c connections.

PacketStar™ PSAX 20 The PacketStar PSAX 20 system is the most scalable and flexible multiservice access product in its class. This scalability enables service providers to meet the demands of a growing enterprise customer with a single-edge solution.
The PSAX 20 optimizes wide area network bandwidth with toll-quality voice compression, traffic optimization, and port scalability from T1/E1 to OC-3c/STM-1 connections.

PacketStar™ PSAX 50 The PacketStar PSAX 50 provides a low-cost, entry-level platform for multiservice access onto a public or private asynchronous transfer mode (ATM) network at speeds up to T-1/E-1. The PSAX 50 unit accommodates up to 10 I/O interfaces, supporting a variety of voice, video, and data connections. It is upgradable to the more powerful PSAX 100 unit simply by upgrading the software.
This low-speed T-1/E-1 integrated access solution is also appropriate for remote sites.

PacketStar™ PSAX 100 The PacketStar PSAX 100 unit offers high-speed (n X T-1/E-1 to OC-3c/STM-1) integrated access at the customer’s premises. Designed to enable service providers to offer multiple applications and broadband services to corporate customers, the PacketStar PSAX 100 unit cost-effectively extends ATM services beyond the wide area network, into the customer premises.
The PSAX 100 unit can accommodate up to 17 I/O interfaces that support a high mix of native applications and broadband services, including 10/100 Mbps Ethernet, frame relay, circuit-switched services for voice and video applications, and high-speed ATM connections for broadband services. The PSAX 100 also supports a wide range of ATM interfaces for network uplink access to a wide area network, including T-1/E-1, T-1/E-1 ATM IMA, T-3/E-3, and OC-3c/STM-1.

<tbody>
<tr>
<td>PSAX 600</td>
<td>PacketStar</td>
<td>The PacketStar PSAX 600 is a more sophisticated unit, ideal for low-end multiservice access concentration in the customer’s premises or small central office. Designed to enable service providers to offer multiple applications and broadband services to multitenant and large enterprise customers, the PacketStar PSAX 600 furnishes a powerful, mid-level broadband service access solution and low-speed ATM access concentration. The PSAX 600 economically supports a high mix of applications and services enabling service providers to deliver advanced data, voice, and video services. The PSAX 600 unit can accommodate up to 57 I/O interfaces supporting 10/100 Mbps Ethernet ports, frame relay, circuit-switched services for voice and video applications, and high-speed ATM connections for broadcast-quality MPEG video over ATM, and high-throughput router and server connections, as well as advanced broadband services.</td>
</tr>
<tr>
<td>Carrier Class Office</td>
<td>PSAX 1250</td>
<td>The PacketStar PSAX 1250 is designed to provide a full range of central office-based multiservice access concentration. Ideal for the central office or a large enterprise’s multiservice access concentration, the PacketStar PSAX 1250 provides highly reliable network access for TDM voice, frame relay, and ATM data applications. The PSAX 1250 I/O interfaces (that include 75 bps to 30 Mbps serial, T-1/E-1, DS3/E-3/STS-1e, OC-3c/STM-1, Ethernet and 2-wire station/office options) are supported by a sophisticated package of features. These features include a PNNI (Private Network-to-Network Interface), ILMI (Integrated Local Management Interface), 1+1 APS (Automatic Protection Switching), trunk alarming, and an SS7 signaling gateway interface. Featuring a 1.2 Gbps ATM cell bus architecture, carrier-class reliability, and full redundancy, the PSAX 1250 is a cost-effective access switch solution for bridging to legacy equipment.</td>
</tr>
<tr>
<td>PSAX 2300</td>
<td>PacketStar</td>
<td>The PacketStar PSAX 2300 offers carrier-grade, high-density multiservice access concentration. Designed to provide multiservice access concentration in the central office or for a large enterprise customer, the PacketStar PSAX 2300 provides network access for TDM voice, frame relay, and ATM data applications. The PSAX 2300 I/O interfaces (that include 75 bps to 30 Mbps serial, T-1/E-1, DS3/E3/STS-1e, OC-3c/STM-1, Ethernet and 2-wire station/office) are supported by a sophisticated package of features, such as PNNI (Private Network-to-Network Interface), ILMI (Integrated Local Management Interface), 1+1 APS (Automatic Protection Switching), trunk alarming, and an SS7 signaling gateway interface. Featuring a 3.9 Gbps ATM cell bus architecture, carrier-class reliability, provisions for OC-12c interfaces, and N x T-1/E-1 module protection switching, the PSAX 2300 solves many demanding and diverse network design challenges with ease.</td>

Getting Started

Overview of This Section

This section provides a general description of the PacketStar™ PSAX 2300 Access Concentrator hardware components, hardware and environmental specifications for the PSAX 2300 Access Concentrator, and guidelines for protecting the equipment from ESD damage. Read this section to ensure that you have ordered the equipment you need for your environment, and that you have all required tools and materials to perform installation.

Using the Installation Checklist

Planning and preparation are essential for completing a successful installation and system startup. An Installation Checklist is provided in the front of this guide. The checklist serves as an overview of the tasks as you progress through the procedures in this guide. Check off the tasks as you complete them.

Before You Begin

Before you start setting up, configuring, and using your new PSAX 2300 system, be sure you complete the following:

• Carefully read the safety cautions listed in the section, “Safety Information,” at the beginning of this guide.

• Record your site-specific specifications such as the IP addresses you will use, and the connections and interfaces you will need. Decide which user names and passwords you will assign.

• Make sure you have IP connectivity to all PSAX devices to be managed.

• Determine the numbering scheme for the in-band connections you will be using.

Product Modification or Repair

Do not make electrical or mechanical modifications to any of the components in the PSAX 2300 systems. Lucent Technologies is not responsible for the safety or the performance of a modified Lucent Technologies product. Do not remove or attempt to repair or modify any components inside the PSAX 2300 chassis. Do not attempt to repair or modify any failed I/O or server modules. Modifying or tampering with PSAX 2300 components voids your warranty.
PSAX 2300 System Hardware Components

The PSAX 2300 Access Concentrator has two options for different system configurations. The following hardware components make up the PSAX 2300 system:

- **Chassis**—two configurations available:
  
  For installing the PSAX 2300 chassis in a standard 48.26-cm (19-in.) or 58.2-cm (23-in) rack cabinet or telco frame, the installation kit provides two types of brackets:
  
  ~ Wide angle brackets for mounting the chassis in a 58.2-cm (23-in.) telco frame
  ~ Small angle brackets for mounting the chassis in a 48.26-cm (19-in.) rack cabinet or telco frame

- **Common equipment modules** (Redundant common equipment modules are required on the PSAX 2300):
  
  ~ -48 V dc Power Supply module
  ~ Stratum 3–4 module
  ~ Central processing unit (CPU) module
• User-selected input/output (I/O) and server modules

A variety of I/O and server modules are available. See the PSAX 2300 Access Concentrator User Guide for more information about the PacketStar I/O and server modules (see “Related Reading” on page 1).

## PSAX 2300 System Hardware Specifications

Electrostatic Discharge (ESD) Precautions

The room in which the PSAX 2300 will be located must have built-in precautions to provide protection from ESD damage to electronic components. To protect your PSAX 2300 system, observe the precautions given below.

Grounding Wrist Straps

Using a grounding wrist strap (see Figure 1) is recommended when installing and operating the PSAX 2300.

Table 13. Facility Power Source Requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum power:</td>
<td>400 W</td>
</tr>
<tr>
<td>Facility grounding:</td>
<td>Availability of common grounding points in the facility is recommended</td>
</tr>
</tbody>
</table>

Figure 1. Grounding Wrist Strap

Follow these guidelines for grounding wrist straps:

- Attach at least one wrist strap to a common ground for each unit/electronic rack to be handled.
- Wrist straps or wrist strap cords should have built-in 1 mega ohm (minimum) resistors for operator protection.
- Wrist straps and wrist strap cords should be UL listed.
- Ensure that the cord for the wrist strap is long enough so that you can wear it while working at the cabinet front or back.
Place the wrist strap so you can touch it first and discharge through it instead of discharging on the cabinet.

Floor Covering

Be sure that the room has antistatic flooring (conductive mat, carpeting, or tiles) to minimize static buildup as you walk across the room. Follow these guidelines for installing and maintaining proper flooring:

- The use of grounding foot straps is recommended while walking in rooms providing antistatic flooring. Foot straps provide additional protection against electrostatic discharge. Foot straps should have built-in 1 mega ohm (minimum) resistors for your protection.

- Wool carpeting is not an acceptable flooring.

Other types of carpeting (when used) require daily spraying with a topical antistatic chemical before any work in the system room is performed. This constant attention to carpeting maintenance is acceptable, but time-consuming.

Humidity

Maintaining the proper humidity in the room where the PSAX 2300 system will be located helps control many static problems. This is especially important during the winter heating season. Follow these guidelines to maintain proper humidity for your PSAX 2300 system:

- Maintain the relative humidity of the room between 40 and 60 percent.

- To avoid damage to equipment, do not allow the humidity to increase to the level where condensation would appear on surfaces.

Clothing

When working with the PSAX 2300 system, avoid wearing clothing made from wool or synthetic materials. Try to minimize contact between clothing and electronic units.

Handling Chassis, Modules, and Components

Follow these guidelines for proper installation and handling of the PSAX 2300 hardware to minimize ESD damage.

- Remove the chassis, modules, and components from their shipping containers immediately before you are ready to install them.

- When installing modules and components, use wrist straps connected to a common ground to prevent electrostatic discharge damage. (A common ground is a circuit that provides a ground to the workplace, personnel, grounding wrist straps and foot straps, and so on—a single ground system.)
Store components in static-shielding bags when those components are not in use.

**Ventilation**

⚠️ **DANGER:**

Openings in the unit are provided for ventilation, to protect it from overheating. These openings must not be blocked or covered. Inadequate ventilation may result in overheating and possible failure of equipment.

Adequate ventilation around the PSAX 2300 system is critical. Be sure that the ventilation openings are not blocked in any way.

If you do not provide adequate ventilation, the equipment might overheat and fail. In table-top systems, the cooling fans could cause buildup of dust on the modules in the chassis. To prevent module failure due to dust contamination, you must periodically check for and remove any dust buildup inside the chassis.

Equipment failure due to lack of adequate ventilation, or due to heavy dust contamination voids your warranty.

**Equipment Grounding**

Be sure that the PSAX 2300 chassis is properly grounded to a common electrical ground. The grounding of the PSAX 2300 chassis is provided from the terminal block on the rear of the chassis. The chassis grounding point must be connected to a common electrical ground to provide proper protection. See “Grounding the Chassis” on page 31 for grounding instructions.

**Tools and Materials Needed**

Before beginning installation procedures, be sure to have the following tools and materials on hand:

- Grounding wrist strap and foot strap
- Small, pocket-sized slotted (flathead) screwdriver
- Cross-recessed screwdrivers:
- Optional power screwdriver (this will save time if you are installing multiple units)
- Nut driver
- Wire cutters and wire strippers
- Plastic cable ties (tie wraps; included with your installation kit)
- Assorted screws (included with your installation kit)
Getting Started
Tools and Materials Needed

- Wire (8-gauge) for grounding the PSAX 2300 chassis
- Metal file (for grounding the PSAX 2300 chassis to the telco frame)
- Wax string (optional for cable management)
Installing and Operating the PSAX 2300 System

Overview of This Section

This section provides detailed procedures for installing the PSAX 2300 Access Concentrator system.

Note: It is recommended that two people (an installer and an assistant) install this equipment. The time required to install a redundant PSAX 2300 system is approximately 3 hours.

⚠️ CAUTION:
Before you begin using the procedures in this section, be sure you have read the “Safety Warnings” and “Getting Started” sections. If you have any questions about or problems with the preparatory tasks, be sure to call Lucent Technologies Technical Support first before beginning the actual installation of the equipment (see “Technical Support”).

Setting Up the Hardware

The PSAX 2300 system is shipped for installation in either a 48.26-cm (19-in) rack cabinet or telco frame, or in a 58.2-centimeter (23-inch) telco frame. See “Mounting the Chassis” on page 28.

To prepare for mounting the PSAX 2300 chassis, determine how you want to position the PSAX 2300 mounting angle brackets, either in the flush-front or mid-mount position. See “Attaching Angle Brackets to the Chassis” on page 25.

⚠️ WARNING:
To avoid the risk of personal injury or possible damage to your equipment or configuration, you must install the PSAX 2300 equipment in a restricted access location.

Attaching Angle Brackets to the Chassis

For installing the PSAX 2300 chassis in a standard 48.26-cm (19-in.) or 58.2-cm (23-in) rack cabinet or telco frame, the installation kit provides two types of brackets:

- Wide angle brackets for mounting the chassis in a 58.2-cm (23-in.) telco frame
- Small angle brackets for mounting the chassis in a 48.26-cm (19-in.) rack cabinet or telco frame

The following options are available for positioning the PSAX 2300 chassis in the rack or frame:
- Mounting angle brackets are placed in a position (front edge of the chassis sidewall), with rack-attaching flanges facing the front for flush-front mounting in a equipment rack. See Figure 2 and Figure 3 for the positioning of the brackets.

Figure 2. PSAX 2300 Chassis with Front-Position-Mounted Wide Brackets to Be Installed in a 23-inch Rack
Figure 3. PSAX 2300 Chassis with Front-Position-Mounted Small Brackets to Be Installed in a 19-inch Cabinet or Rack
Mounting the Chassis

Before installing the chassis in a rack cabinet or telco frame, you must attach the angle brackets in the desired position to the PSAX 2300 chassis (see "Attaching Angle Brackets to the Chassis" on page 25).
When populated with modules, the PSAX 2300 chassis weighs approximately 22.29 kg (49.1 lb). Lifting or holding such a load while trying to fasten it to a rack can be hazardous, especially when working alone. To avoid personal injury or damage to the equipment, mount and securely bolt the chassis to the rack or the frame before inserting the modules. Two installers should perform this procedure.

Perform the following steps to mount the chassis to a rack or frame:

1. Place the chassis top-side up (with the slot numbers visible on a flange just below where modules are inserted) in the desired position in the rack cabinet or the frame.

2. Align the holes on the mounting brackets with the holes on the telco frame. (Use a network diagram provided by your network designer, if available, to identify the correct location for the chassis.) Two installers should complete this step so that one person can hold the chassis in place, while the other person inserts the screws through the mounting brackets and into the cabinet or frame.

3. Secure the chassis to the cabinet or the frame with the screws provided in the installation kit as shown in Figure 5, Figure 6 on page 30, and Figure 7 on page 30.
4 Repeat steps 1 through 3 for each chassis in the rack or frame.
Grounding the Chassis

⚠️ WARNING: When using a DSP module and an Enhanced DS1/E1 module with a PBX and/or key telephone system, the PSAX 2300 system and your equipment must use a common chassis ground connection to avoid ground current loops, which could affect voice quality.

Be sure that the PSAX 2300 is properly grounded to a common electrical ground. Use one of the following methods to ground the chassis.

Connect the facility ground wire to the PSAX 2300 chassis by following these steps:

1. Insert the bare end of the facility grounding wire into the terminal block, labeled FGND, which is located on the rear of the chassis housing.
2. Using a slotted screwdriver, tighten the captive screw in the terminal block securely as shown in Figure 8.

3. Place two strain-relief retaining clamps around the wire (also shown in Figure 8), push the two clamps positioned at right angles onto the threaded stud, and securely attach the nut to the stud with a nut driver.
4. Connect the other end of the grounding wire to either the telco frame (if the frame is grounded) or to the facility grounding point.

Figure 8. Attaching the Ground Wire and Strain-Relief Retaining Clamp to the Terminal Block
Connecting the Facility Power Wires

⚠️ DANGER:
Ensure that a fuse panel is already installed in the rack cabinet or telco frame and the facility power is properly attached to the fuse panel on the rack. Make sure the power to the fuse panel is turned off.

Before you begin the following procedure, check with the facility manager to ensure that a fuse panel has been properly installed in the cabinet or rack.

1 Turn off the facility power at the fuse panel.

2 To prepare your power cabling, cut off 1/4-in. insulation on either end of the red and black power wires using wire strippers, and twist the bare strands of wire together, as shown in Figure 9.

3 Connect the red (-48 V dc) and black (return) wires at the fuse panel.
4 Insert the bare ends of the red and black wires into the openings in the terminal block on the rear of the chassis housing, placing the red wire into the opening labeled -48V and the black wire into the opening labeled RTN, as shown in Figure 10.

5 Tighten both captive screws in the terminal block to hold the wires firmly in place.

6 Place two strain-relief retaining clamps around the wire (also shown in Figure 10), push the two clamps positioned at right angles onto the threaded stud, and securely attach the nut to the stud with a nut driver.

7 Repeat steps 2 through 6 for attaching the second set of red and black wires to the second terminal block.
See Figure 11 for an illustration of how the rear of the chassis appears when facility power and ground wires are properly attached.

**Note:** Do not yet turn on the power at the fuse panel.

### Installing the Common Equipment Modules

Install the common equipment modules first in the PSAX 2300 chassis, before installing the I/O and server modules. See Figure 12 for an illustration of slot numbering on the 48.26-cm (19-in) PSAX 2300 chassis.

![Slot Numbers in the PSAX 2300 Chassis](image)

### Installing the Power Supply Modules

Perform the following steps to install the Power Supply modules in the chassis.
Note: Do not yet turn on the power at the fuse panel.

1. Slide the Power Supply module into one of the large openings at the bottom of the chassis, and push it firmly until it snaps into the chassis backplane, as shown in Figure 13.

2. Using a slotted screwdriver, tighten the two captive screws on both sides of the power supply module, as shown in Figure 14.

3. Repeat steps 1 and 2 to install the second (redundant) Power Supply module into the other large opening in the bottom of the chassis.
Installing the Stratum 3–4 Modules

Perform the following steps to install the Stratum 3–4 modules in the chassis.

1. Remove the Stratum 3–4 module from its protective packing material and protective bag. Save these materials for future use, if needed.

2. Open the ejector handle on the bottom side of the module faceplate, and slide it into slot A of the chassis. Ensure you position the module with the ejector handle near the bottom edge of the chassis opening, as shown in Figure 15.

3. Press the ejector handle until it snaps firmly against the faceplate, and verify that the module is secure in its slot.

4. Tighten the captive screw in the ejector handle using a crossed-recess screwdriver, as shown in Figure 15.

5. Tighten the captive screw at the upper edge of the module using a slotted screwdriver, as shown in Figure 15.

6. Repeat steps 1 through 4 to install the second (redundant) Stratum 3–4 module into slot B.

Installing the CPU Modules

Perform the following steps to install the CPU modules in the chassis.

1. Remove the CPU module from its protective packing material and protective bag. Save these materials for future use, if needed.

2. Open the ejector handle on the top side of the module faceplate, and slide it into slot 16 in the chassis. Ensure you position the module with the ejector handle near the top edge of the chassis opening.

3. Press the ejector handle until it snaps firmly against the faceplate, and verify that the module is secure in its slot.
4 Repeat steps 1 through 3 to install the second (redundant) CPU module in slot 17.

Installing the I/O and the Server Modules

Install the PSAX 2300 common equipment modules first (see “Installing the Common Equipment Modules” on page 34), before installing the I/O and the server modules.

Perform the following steps to install the I/O and server modules in the chassis:

1. Open the ejector handle on the top side of the module faceplate, and slide it into any slot numbered 1 through 15 in the chassis. Ensure you position the module with the ejector handle near the top edge of the chassis opening.

2. Press the ejector handle until it snaps firmly against the faceplate, and verify that the module is secure in its slot.

3. Repeat steps 1 and 2 for all remaining I/O and server modules that you want to install.

4. Insert blank faceplates (separately orderable parts) into any remaining empty slots.

⚠️ WARNING:
Be sure to cover all empty slots with blank faceplates to maintain optimum electromagnetic interference (EMI) shielding of the chassis.

⚠️ DANGER:
The OC-3c Single Mode (SM) and the STM-1 Single Mode (SM) modules contain a laser-generating device, which emits a laser light beam from the transmit port, labeled TX on the module faceplate. While the module is inserted into an operational (power is applied) PSAX 2300 chassis, do not look directly (deliberately or accidentally) into either port, because direct contact of the laser beam will damage the human eye.

⚠️ WARNING:
Once the PSAX 2300 chassis is operational (power is applied to the chassis) and the OC-3c SM or STM-1 SM module is fully inserted into the chassis backplane, use extreme caution if you need to remove the fiber-optic cable from one or both ports. Keep the protective port caps supplied with these two types of modules nearby (for example, taped to the cable for the port), and place a cap on the port immediately after removing a cable from a live module.

Connecting Your Network Cabling

Once all modules are fully installed in the PSAX 2300 chassis, use the steps in the following procedure to connect your network cabling to the module and chassis interface connectors.
Installing and Operating the PSAX 2300 System
Operating the System

Note: You must supply most of your own network cabling. Specialized cables for the Multi-Serial and the High-Speed modules are available as separately orderable parts.

1 To provide Stratum 3–4 clock synchronization, connect your network cabling (user supplied) to the EXTERNAL SYNC. port on the Stratum 3–4 faceplate.

2 Connect the network cabling for your chosen I/O modules to the connectors on the module. If applicable, refer to the appropriate module user guide for pin configurations (see “Related Reading” for a list of the I/O and server module user guides).

Operating the System

Before starting up your PSAX 2300 system, be sure you have:

• Installed the Power Supply module(s), the Stratum 3–4 module(s), the CPU module(s), and the I/O and server modules
• Verified that all modules are properly seated in the chassis
• Verified that your network and electric power cabling connections are done correctly

Connecting the Console Workstation to the PSAX 2300 System

You can connect your PSAX 2300 system to a console workstation in one of two ways:

• Connect the PSAX 2300 system directly to a personal computer workstation by using the serial interface cable supplied in the installation kit.
• Connect the PSAX 2300 system to an Ethernet device by using an Ethernet cable (user-supplied).

To install the serial interface cable for connecting the PSAX 2300 system directly to a personal computer workstation (or notebook computer), use the steps in the following procedure:

Connecting the Serial Interface Cable

Begin

1 Install the RJ11-to-DB9 adaptor (supplied in the installation kit) into a serial port on the personal computer.

2 Insert one RJ11 connector on the serial interface cable (supplied in the installation kit) into the RJ11 port labeled CONSOLE on the Stratum 3–4 module faceplate, and the other RJ11 connector into the RJ11-to-DB9 adaptor.

End
To install an Ethernet cable for connecting the PSAX 2300 system to an Ethernet device, use the steps in the following procedure:

**Connecting the Ethernet Cable**

*Begin*

1. Insert one RJ45 connector on the Ethernet cable into the RJ45 port labeled ETHERNET on the PSAX 2300 chassis faceplate.

2. Insert the other RJ45 connector into the desired Ethernet device (such as a hub).

*End*

**Supplying Power to the System**

1. Verify that your power cabling connections on the rear of the chassis housing are secure.

2. Turn on the power to the chassis at the fuse panel on the rack.

*System response*: The PSAX 2300 system initializes (takes about 30 seconds).

**Checking the LED Indicators**

Once you have supplied power to your PSAX 2300 system, verify that the LED indicators on the equipment modules and each I/O module are reporting the correct status:

1. Check to see that the green light-emitting diode (LED) indicators, ACTIVE, on both Power Supply modules (or one for a nonredundant system) are illuminated. If the red LED indicator, FAIL, is illuminated, the Power Supply module is not functioning, or the power source is not providing power.

*Note*: If your PSAX 2300 system does not start up correctly, contact Lucent Technologies, Inc. Technical Support (see "Technical Support" on page 8).

2. Check the CPU module(s), Stratum 3–4 module(s), and each I/O module to ensure that their LED indicators are reporting the correct status. See "Status Indicators for the Common Equipment Modules" on page 40 for details.
Shutting Down the System

⚠️ DANGER:
Shock hazard! Do not perform any maintenance on this equipment until you have turned off the power using the specified procedure. Failure to observe proper precautions could cause serious injury or death. Neither the PSAX 2300 chassis nor the Power Supply module has an on/off switch. The power to the chassis is controlled at the fuse panel.

1. Turn off the power to the chassis at the fuse panel on the rack.
2. Disconnect the power cables from the rear of the chassis housing.

Status Indicators for the Common Equipment Modules

The common equipment modules have light-emitting diode (LED) indicators that provide visual status of various functions in the modules. Status indicators for the Power Supply module, the Stratum 3–4 module, and the CPU module are described in this section. (See the appropriate PacketStar™ Access Concentrator module guides for descriptions of the LED indicators on the I/O modules you are using.)

Power Supply Module Status Indicators

The -48 V dc Power Supply module has three types of LED indicators. This module is shown in Figure 16.

Figure 16. Status Indicators on the PSAX 2300 -48 V dc Power Supply Module
The status indicators for the Power Supply module are shown in Table 14.

Table 14. Description of the PSAX 2300 Power Supply Module Status Indicators

<table>
<thead>
<tr>
<th>Color</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>FAIL</td>
<td>Indicates that the Power Supply module is not functioning or connected to a power source.</td>
</tr>
<tr>
<td>Green</td>
<td>ACTIVE</td>
<td>Indicates that the Power Supply module is functioning properly. Do not use.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The Power Supply module has no on/off switch. The green ACTIVE LED is illuminated when the Power Supply module is properly inserted into the chassis backplane, and the power cabling is properly connected.</td>
</tr>
<tr>
<td>Yellow</td>
<td>non-redundant</td>
<td>Indicates two different conditions depending on whether one or two Power Supply modules are in use: When only one Power Supply module is installed, a yellow LED indicates that the chassis has no redundant module.</td>
</tr>
</tbody>
</table>

Stratum 3–4 Module Status Indicators

The Stratum 3–4 module has three types of LED indicators, as shown in Figure 17.

Figure 17. Status Indicators on the PSAX 2300 Stratum 3–4 Module
The status indicators for the Stratum 3–4 module are described in Table 15.

**Table 15. Description of the PSAX2300 Stratum 3–4 Module Status Indicators**

<table>
<thead>
<tr>
<th>Color</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>FAIL</td>
<td>Indicates that the Stratum 3–4 module is not functioning.</td>
</tr>
<tr>
<td>Green</td>
<td>ACTIVE</td>
<td>Indicates that the Stratum 3–4 module is functioning properly.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In a redundant configuration, the green LED identifies which of the two stratum modules is providing system synchronization. The green LED on the redundant stratum module (in standby mode) is not illuminated.</td>
</tr>
<tr>
<td>Yellow</td>
<td>CLK LOS</td>
<td>Indicates a loss of signal from the external composite clock synchronization source. This LED indicator is operational only when the synchronization source value <strong>CompositeClock</strong> was selected on the Stratum Configuration screen. This LED is not operational when synchronization source values <strong>Freerun</strong> or <strong>LineTiming</strong> are selected.</td>
</tr>
<tr>
<td></td>
<td>UNLOCKED</td>
<td>Indicates that the Stratum 3–4 is not locked to a reference signal.</td>
</tr>
<tr>
<td>Yellow</td>
<td>Lamp Test</td>
<td>Tests the operational status of the LED indicators.</td>
</tr>
</tbody>
</table>
CPU Module Status Indicators

The CPU module has three types of LED indicators, as shown in Figure 18.

![Figure 18. Status Indicators on the PSAX 2300 CPU Module](image)

The status indicators for the CPU module are described in Table 16.

**Table 16. Description of the PSAX 2300 CPU Module Status Indicators**

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>FAIL</td>
<td>Indicates that the CPU module is not functioning</td>
</tr>
<tr>
<td>Green</td>
<td>ACTIVE</td>
<td>Indicates that the CPU module is functioning properly. Both modules in a redundant configuration have illuminated green LEDs.</td>
</tr>
<tr>
<td>Yellow</td>
<td>LOAD</td>
<td>Indicates that the module is initializing the PSAX 2300 system software from the hard disk on the module.</td>
</tr>
</tbody>
</table>
Removing Modules from the Chassis

You can remove any of the I/O and server modules, the CPU modules, the Stratum 3–4 modules, and the Power Supply modules from the PSAX 2300 chassis with the system running, that is, with power applied to the chassis. The design of the PSAX 2300 system supports live insertion and removal of modules without disrupting service on the other modules in the system.

⚠️ WARNING:
Be sure to cover all empty slots with blank faceplates to maintain optimum electromagnetic interference (EMI) shielding of the chassis.

⚠️ DANGER:
The OC-3c Single Mode (SM) and the STM-1 Single Mode (SM) modules contain a laser-generating device, which emits a laser light beam from the transmit port, labeled TX on the module faceplate. While the module is inserted into an operational (power is applied) PSAX2300 chassis, do not look directly (deliberately or accidentally) into either port, because direct contact of the laser beam will damage the human eye.

⚠️ WARNING:
Once the PSAX 2300 chassis is operational (power is applied to the chassis) and the OC-3c SM or STM-1 SM module is fully inserted into the chassis backplane, use extreme caution if you need to remove the fiber-optic cable from one or both ports. Keep the protective port caps supplied with these two types of modules nearby (for example, taped to the cable for the port), and place a cap on the port immediately after removing a cable from a live module.

To remove a Power Supply module, perform the following steps:

1. Using a screwdriver, loosen the two captive screws on both sides of the power supply module.
2. With steady backward pressure, pull the module straight out of the chassis.
3. Put the module in an ESD protective bag, and close the bag with adhesive tape.

To remove a Stratum 3–4 module, perform the following steps:

1. Disconnect the cable, if one is being used, from the port.
2. Using a screwdriver, loosen the captive screw in the ejector handle.
3. Pull backward on the ejector handle until the module is slightly pulled out of the slot.
4. Put the module in an ESD protective bag, and close the bag with adhesive tape.

To remove a CPU module or an I/O or server module, perform the following steps:

1. Disconnect the cables from the port(s).
Installing and Operating the PSAX 2300 System

Shipping the System

At some point, you might need to ship your PSAX 2300 system to another location. To prepare the system for shipment, do the following:

⚠️ **DANGER:**
When populated with modules, the PSAX 2300 could weigh 22.29 kg (49.1 lb) or more. Lifting or holding such a load while trying to unfasten it from a rack can be hazardous, especially when working alone. To avoid personal injury or damage to the equipment, remove all the modules from the chassis before removing the chassis from the rack. Two installers should perform this procedure.

1. After removing power from the system, remove all modules from the chassis, place them in ESD protective bags, seal the bags with tape, and then place them in sturdy cartons with foam packing material (use the original packaging if you saved it).

⚠️ **CAUTION:**
Shipping the chassis with removable modules installed may cause damage to the chassis and the modules. Damage to any of the components in the system resulting from shipping the chassis with removable modules installed could void your warranty. Only Lucent-authorized personnel should ship the PSAX 2300 chassis with a module installed.

2. Remove and save the mounting screws.

3. Place the PSAX 2300 chassis in a sturdy carton (use the original packaging if you saved it). Use foam packing material to cushion the equipment.

4. Secure the boxes with heavy-duty packaging tape.

5.
A  Pin Configurations

Overview of This Appendix

This appendix describes the pinout configurations for the connectors on the PSAX 2300 common equipment modules.

Configuration for the CPU Connectors

Two different interfaces are available for direct access to the CPU module. You can use the console serial interface or the Ethernet interface to connect to the terminal emulator for configuring and managing the PSAX 2300 system.

Console Serial Interface

The serial port console interface of the CPU module faceplate accepts an RJ-11 connector. The faceplate connector accommodates the standard RJ-11 interface; however, due to differences among manufacturers of connectors, be sure to check your cable and connector to determine what type you have. DB9 connectors are available with different wire-coloring schemes. If you are using the serial port of a personal computer (PC) or workstation as the console, use a standard DB9 female connector with an attached RJ-11 connector. Be sure to use the correct type of cable to ensure proper operation. Table 1 and Table 2 describe the pin configuration for DB9 connectors with two different wire coloring schemes.

Table 1. Pin Descriptions for the Serial Interface DB9 Connector with Black/Red/Green Wires

<table>
<thead>
<tr>
<th>Pin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>5</td>
<td>Green = Ground</td>
</tr>
</tbody>
</table>
Chapter A Pin Configurations
Configuration for the CPU Connectors

The SUN Microsystems workstation (as well as other types of workstations) can also be used to connect to the console serial port. If you are using the serial port of a SUN workstation as the console, use a DB25 male connector. Table 3 describes the pin configuration for the DB25 connector.

### Table 3. Pin Descriptions for the Serial Interface DB25 Connector

<td>Green = Ground</td>
</tr>
</tbody>
</table>

### Ethernet 10Base-T Interface

The CPU module faceplate also accommodates the Ethernet interface using standard RJ-45 pin assignments. Figure 19 shows the pin locations for the RJ-45 connector for the 10Base-T connector on the faceplates.

![Ethernet Connector Diagram](image)

**Figure 19. Pin Locations on the RJ-45 Connector**

</tbody>
</table>

Configuration for the Stratum 3–4 Connector

The composite clock signal for the PSAX 2300 Stratum 3–4 module is a 64-Kbps bipolar signal with an 8-Kbps bipolar violation signal. Figure 20 is a diagram for general reference only. Detailed parameters for the composite clock signal are described in Bellcore document TA-TSY-000378. ITU G.703.

The composite clock signal is a balanced signal, which is transmitted over a shielded twisted pair cable. The cable shield is grounded at the composite clock source.
Table 5 describes the pin configuration for the faceplate connector on the Stratum 3–4 module.

European Community Declarations of Conformity

Overview of This Appendix

This appendix contains the European Community (EC) Declarations of Conformity for Electromagnetic Compatibility Directives, as applicable to the PSAX 2300 Access Concentrator.
We,

Lucent Technologies
Access Technology Division
8301 Professional Place
Landover, Maryland 20785
USA

declare, under our sole responsibility, that the product:

Lucent Technologies PSAX 2300 ATM Access Concentrator, consisting of the following model numbers:

20N40, 20N41, 20N56, 20N62, 20N63, 20N64, 20N65, 20N92, 20N93, 23A63, 23A64, 23A67,
23N05, 23N11, 23N27, 23N28, 23N66
to which this declaration relates, is in conformity with the following standard(s) or other normative documents

EN 300 386-2:1997
EN 55024:1998
EN 55022:1998

in accordance with the provisions of the Electromagnetic Compatibility Directive (EMC) 89/336/EEC.

I, the undersigned, hereby declare that the equipment specified above conforms to the listed directives and standards.

Place of Issue: Landover, Maryland; USA
Date: June 26, 2000
