

Telnet security update - (RHSA-2005-327)

Advisory Original Release Date: June 14, 2005

Last Revised: January 18, 2006

Number: ASA-2005-132

Risk Level: Low

Advisory Version: 1.0

Advisory Status: Interim

Overview:

The telnet package provides a command line telnet client.

Multiple security vulnerabilities were discovered in telnet. If a victim can be tricked into connecting to a malicious telnet server, these vulnerabilities could allow an attacker to execute arbitrary code on a victim's machine. Certain Avaya products ship with the telnet package and therefore are affected by these vulnerabilities. The Common Vulnerabilities and Exposures project (cve.mitre.org) has assigned the name [CAN-2005-0468](#) and [CAN-2005-0469](#) to these issues.

More information about these vulnerabilities can be found in the security advisory issued by Red Hat:

Avaya Software-Only Products

Avaya software-only products operate on general-purpose operating systems.

Occasionally vulnerabilities may be discovered in the underlying operating system or applications that come with the operating system. These vulnerabilities often do not impact the software-only product directly but may threaten the integrity of the underlying platform.

In the case of this advisory Avaya software-only products are not affected by the vulnerability directly but the underlying Linux platform may be. Customers should determine on which Linux operating system the product was installed and then follow that vendors guidance:

Software-Only Products

Product	Affected S/W Version	Actions
Avaya™ CVLAN	All versions	<p>Depending on the Operating System provided by customers, the affected package may be installed on the underlying Operating System supporting the CVLAN application.</p> <p>The CVLAN application does not require the software described in this advisory. Avaya recommends that customers follow recommended actions supplied by the Operating System vendor (e.g. Red Hat) or remove the affected package.</p>
